

PART B

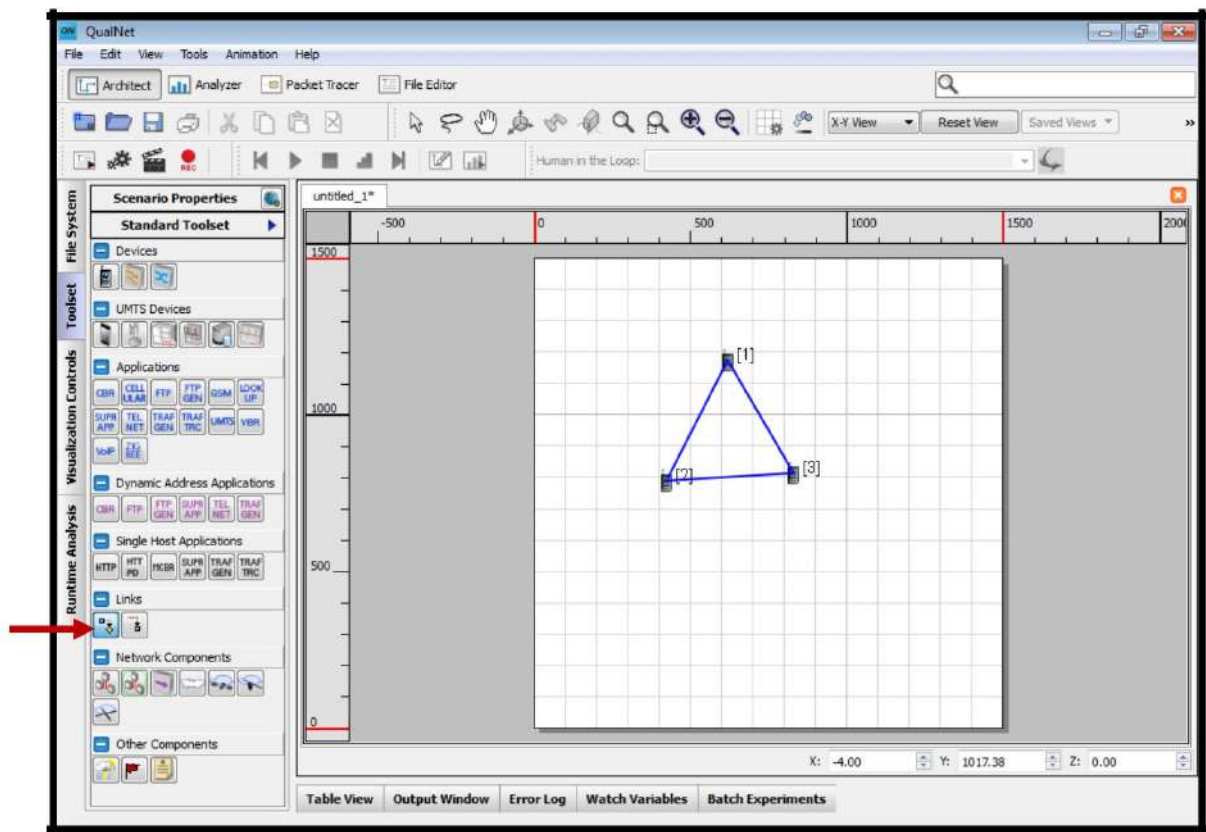

EXPERIMENT NO 1 .

Simulate a three point-to-point network with duplex links between them. Set the queue size and vary the bandwidth and find the number of packets dropped.

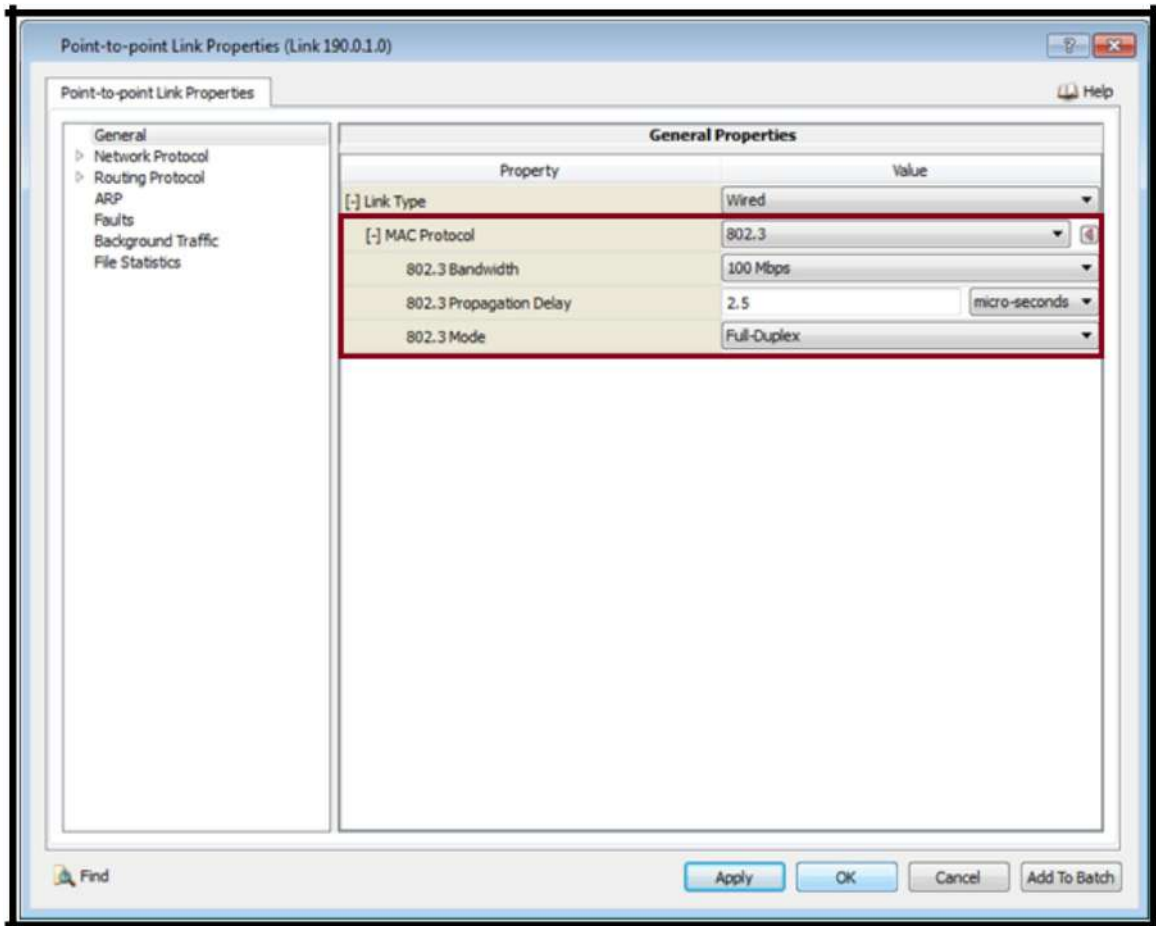

Step 1: Select Default icon from **Standard Toolset window** and Place the three nodes on the canvas.

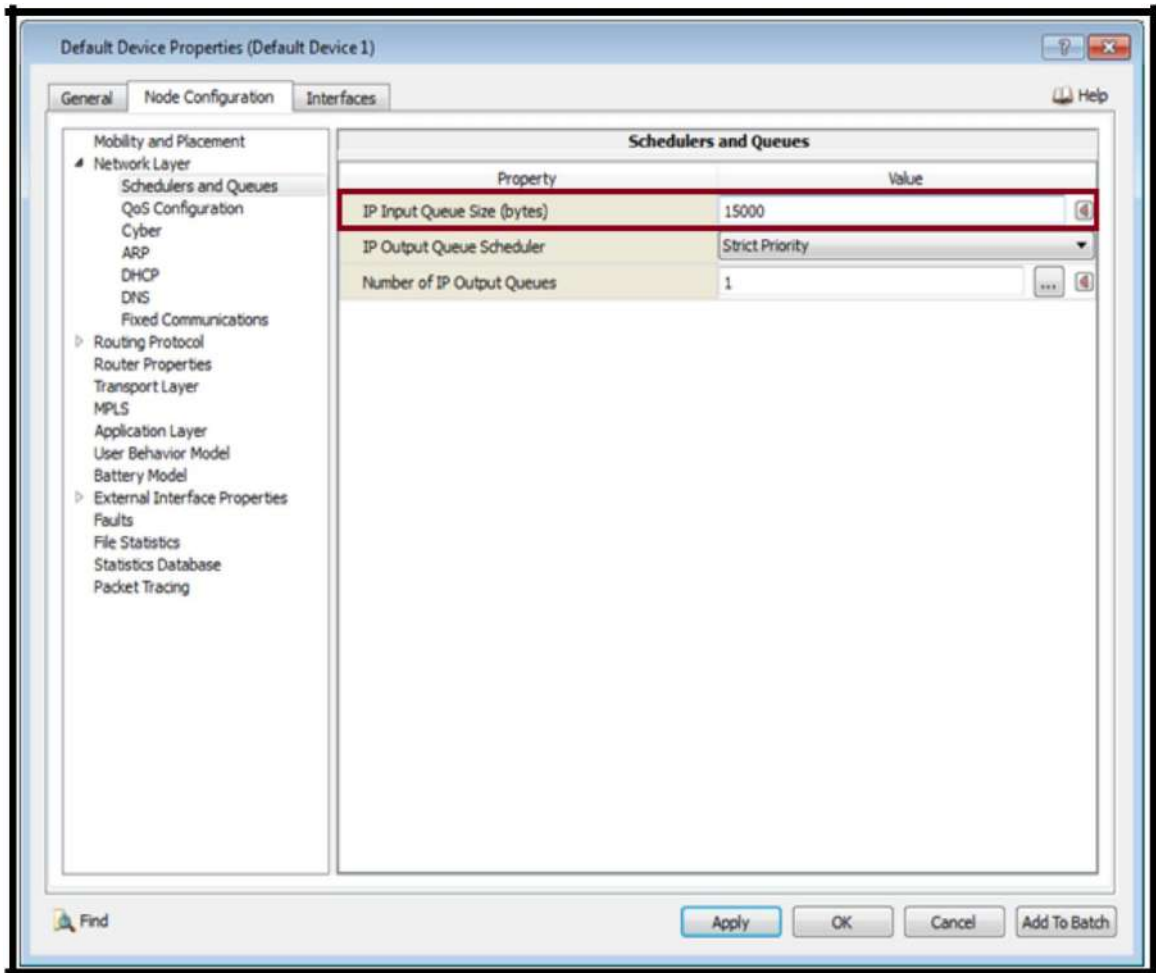

Step 2: Connect point-to-point link between three nodes using **link** from **Standard Toolset** window

Step 3: Double click on link to set duplex link and bandwidth between the nodes by configure 802.3 as MAC Protocol.

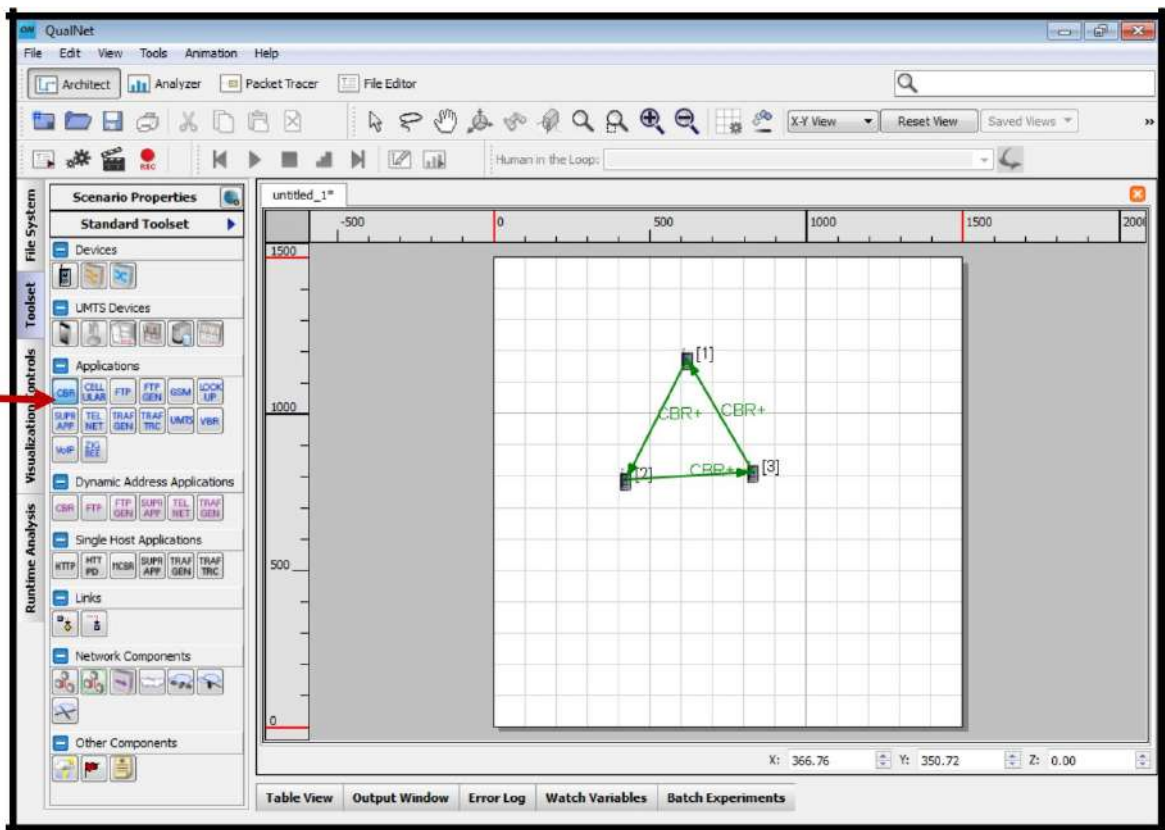

Step 4: To set queue size of each node in the scenario double click on the nodes, go to Node Configuration tab->Network Layer-> Schedulers and Queues.

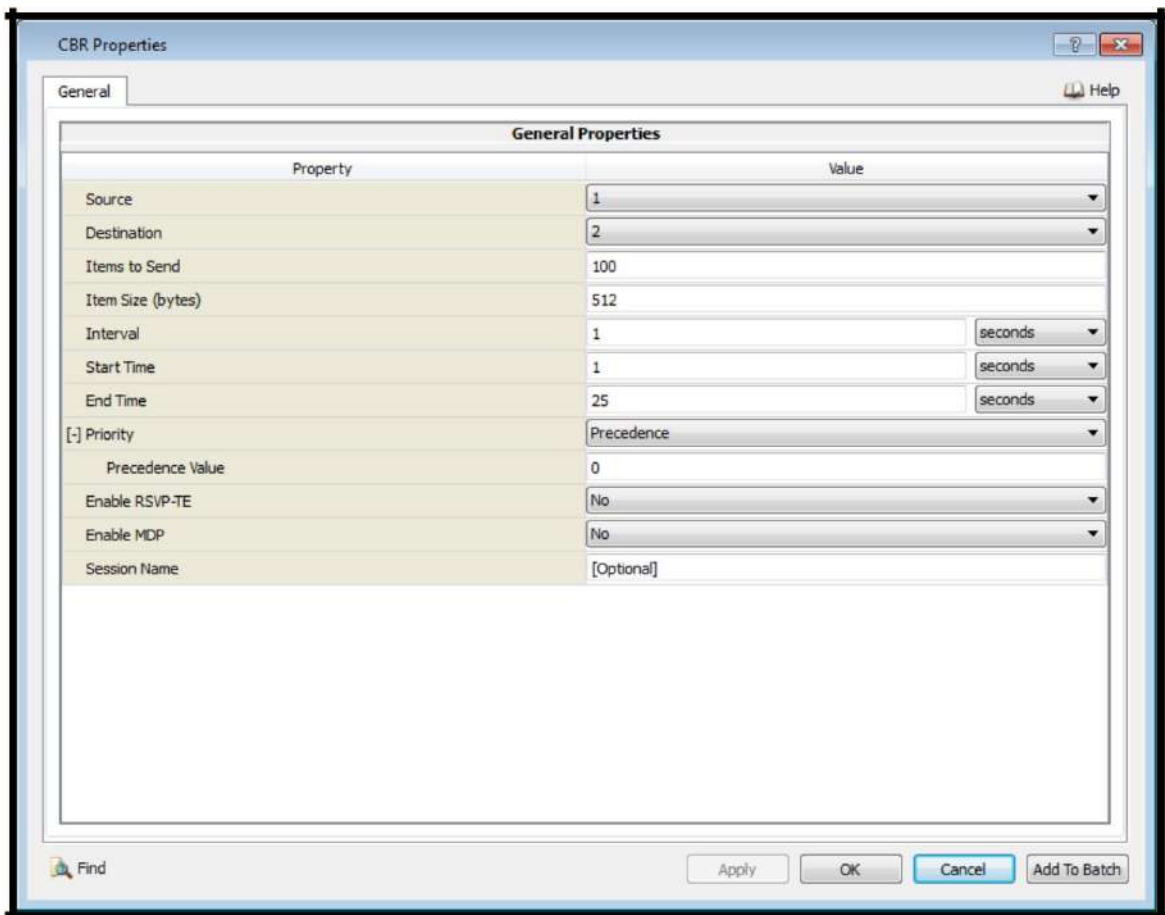

Step 5: Select the **Applications** tab of **Standard Toolset** window

Select **CBR** and draw the application between Node 1 and Node 2.
Similarly Node 2 to Node 3 and Node 3 Node 1

Step 6: To set CBR Application parameters, go to Table View (bottom panel of GUI) ->Application Tab-> double click on CBR Application

Set the Number. of CBR packets(Items to send) as per the user requirement

The screenshot shows the 'CBR Properties' dialog box with the 'General' tab selected. The 'General Properties' section contains the following parameters:

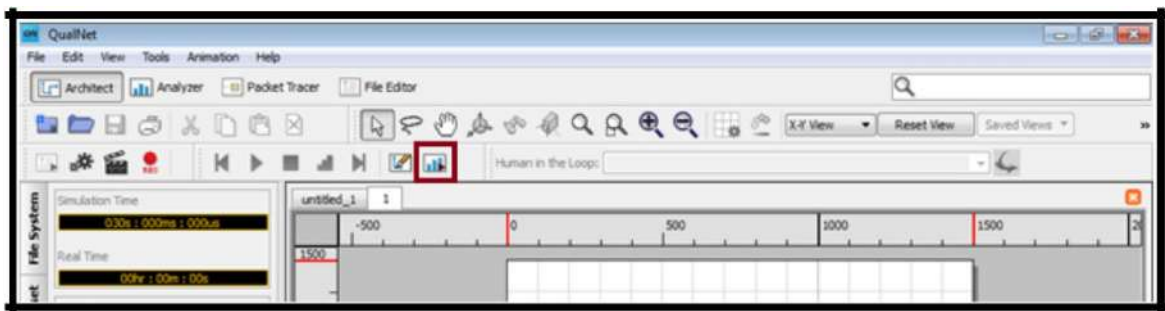

Property	Value
Source	1
Destination	2
Items to Send	100
Item Size (bytes)	512
Interval	1 seconds
Start Time	1 seconds
End Time	25 seconds
[.] Priority	Precedence
Precedence Value	0
Enable RSVP-TE	No
Enable MDP	No
Session Name	[Optional]

At the bottom of the dialog, there are buttons for 'Find', 'Apply', 'OK', 'Cancel', and 'Add To Batch'.

Step 7: Save the changes by clicking on the **Save** button. Click on the **Run** button. Click on the **Play** button to execute the scenario.

Step 8: On completion of the Scenario execution, check the corresponding Statistics for the desired results click on **Analyze statistic**.

Step 9: To check the no. of packets at sender, go to Application tab->CBR Client->Total Unicast Messages Sent

To check the no. of packets at receiver, go to Application tab->CBR Server->Total Unicast Messages Received

Note: The packet drop is calculated as follows:

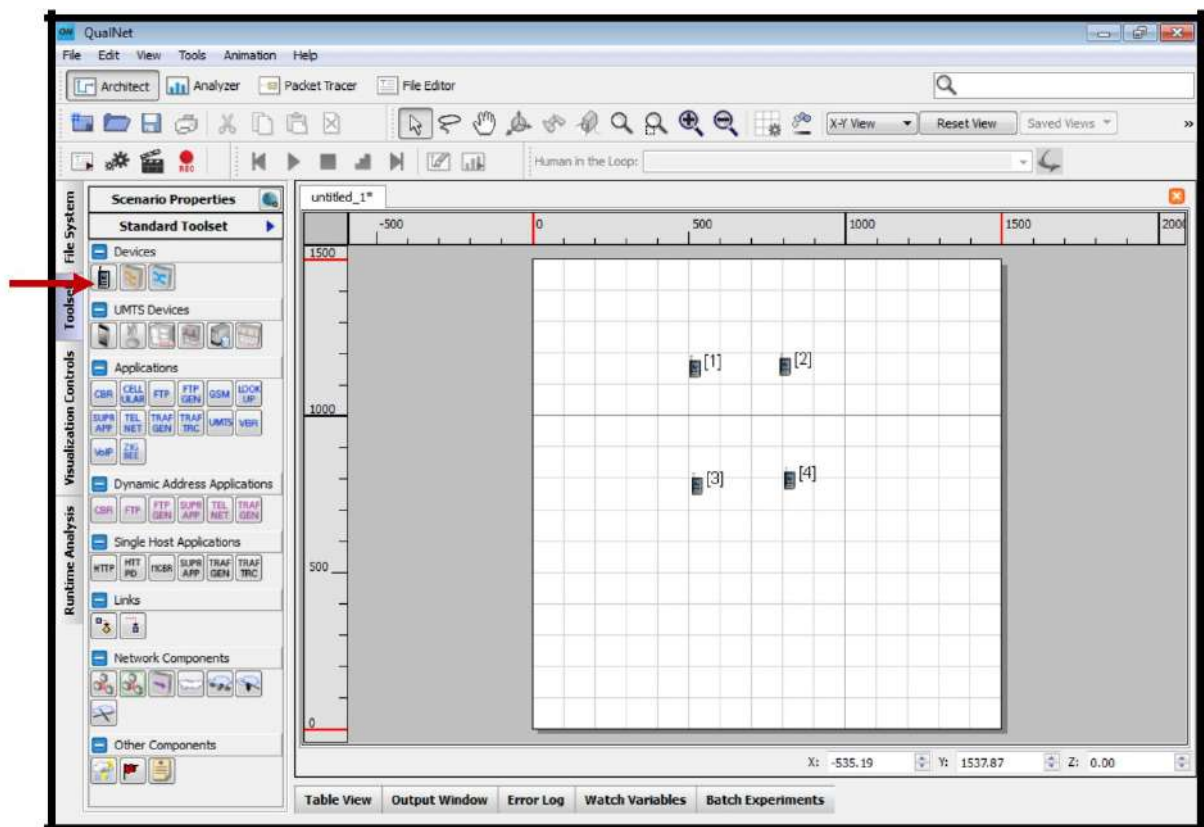

$$\text{Packet drop} = \text{Total no. of packets sent} - \text{Total no. of packets received}$$

EXPERIMENT NO 2

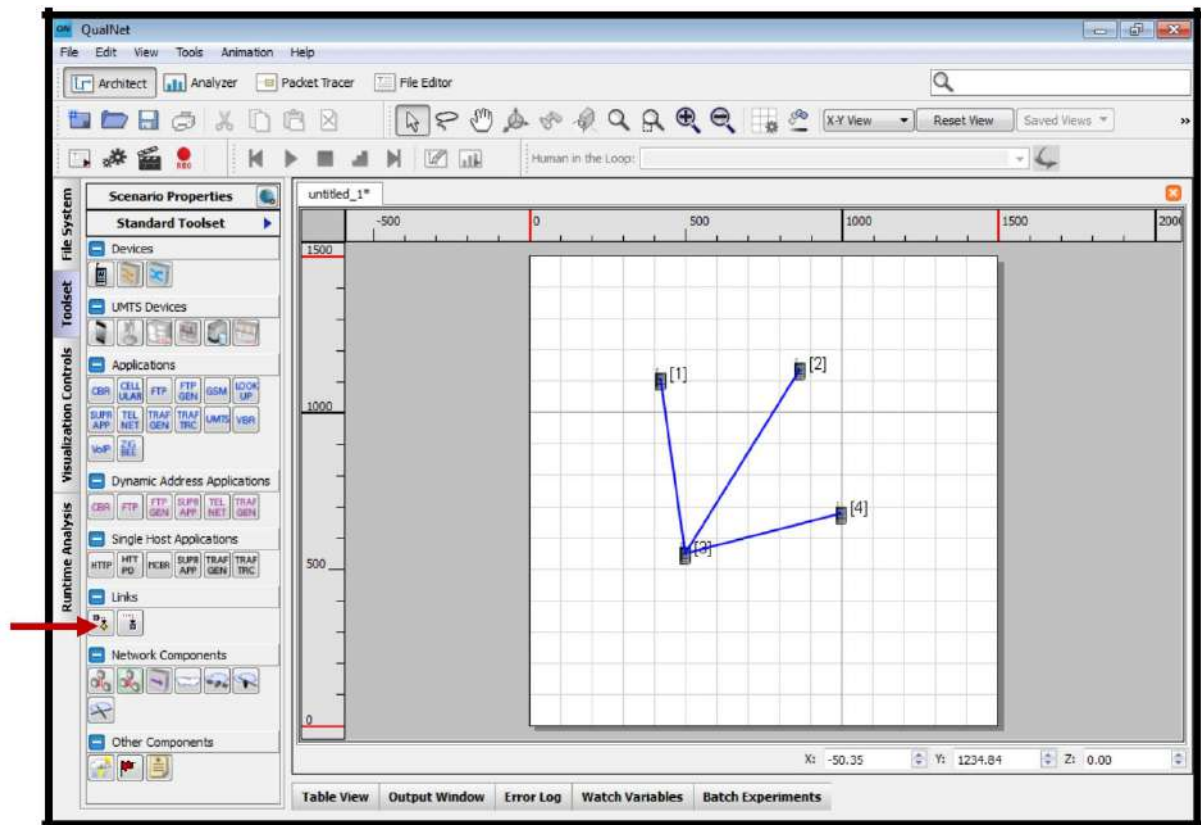

Simulate a four node point-to-point network with the links connected as follows:

n1-n3, n2-n3 and n3-n4, Apply TCP agent between n1-n4 and UDP between n2-n4. Apply relevant application over TCP and UDP agents changing the parameters and determine the number of packets sent by TCP/UDP.

Step1: Select Default icon from **Standard Toolset window** and Place the four nodes on the canvas.

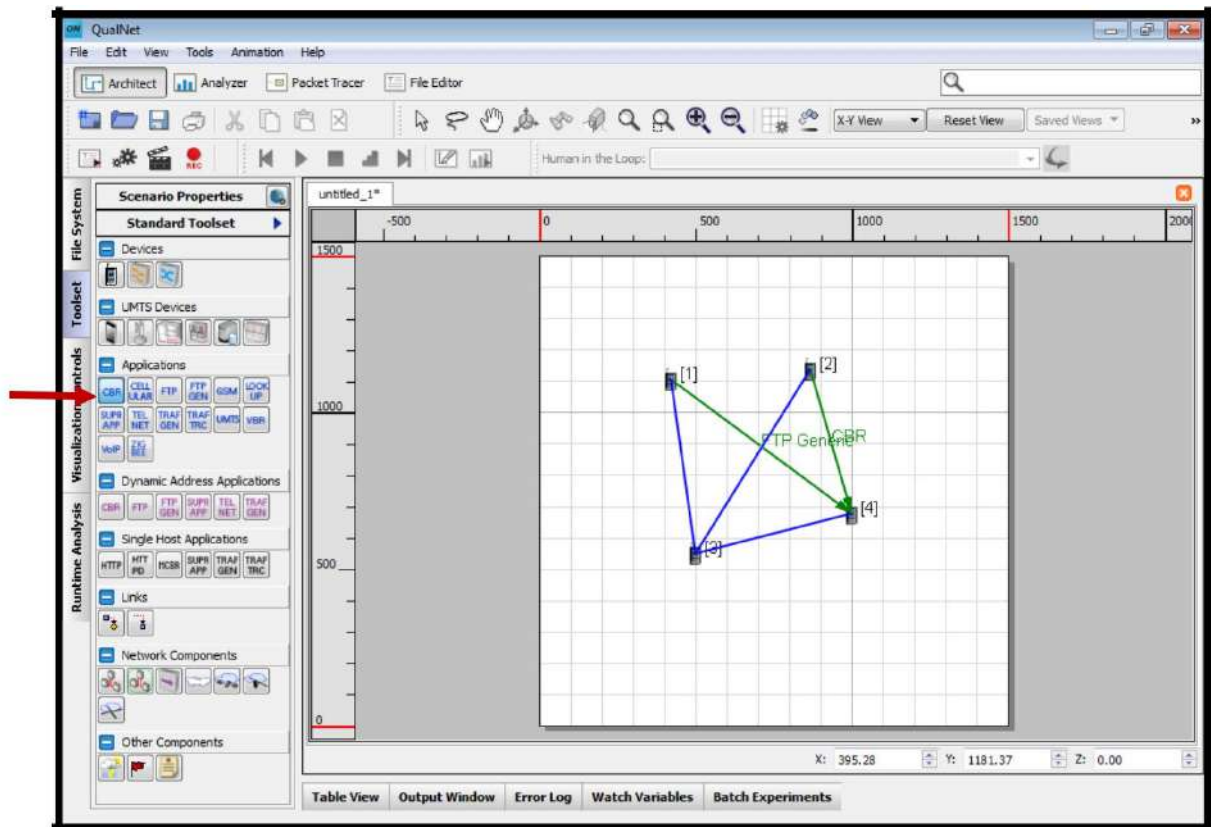

Step 2: Connect point-to-point link between four nodes using **link** from **Standard Toolset** window

Step 3: Select the **Applications** tab of **Standard Toolset** window

Select **CBR** and set the application between Node 2 and Node 4.

Similarly Select **FTP Generic** and set the application between Node 1 and Node 4

Step 4: To set CBR Application parameters, go to Table View (bottom panel of GUI) ->Application Tab-> double click on CBR Application

Set the Number Of CBR packets (Items to send) as per the user requirement

The screenshot shows the 'CBR Properties' dialog box with the 'General' tab selected. The dialog contains a table of properties and their values, along with several checkboxes and a text field at the bottom.

Property	Value
Source	2
Destination	4
Items to Send	100
Item Size (bytes)	512
Interval	1 seconds
Start Time	1 seconds
End Time	25 seconds
[...] Priority	Precedence
Precedence Value	0
Enable RSVP-TE	No
Enable MDP	No
Session Name	[Optional]

At the bottom of the dialog, there are buttons for 'Find', 'Apply', 'OK', 'Cancel', and 'Add To Batch'.

Step 5: To set **FTP Generic** Application parameters, go to Table View (bottom panel of GUI) ->Application Tab-> double click on FTP Generic Application

Set the no. of **FTP Generic** packets(Items to Send) as per the user requirement

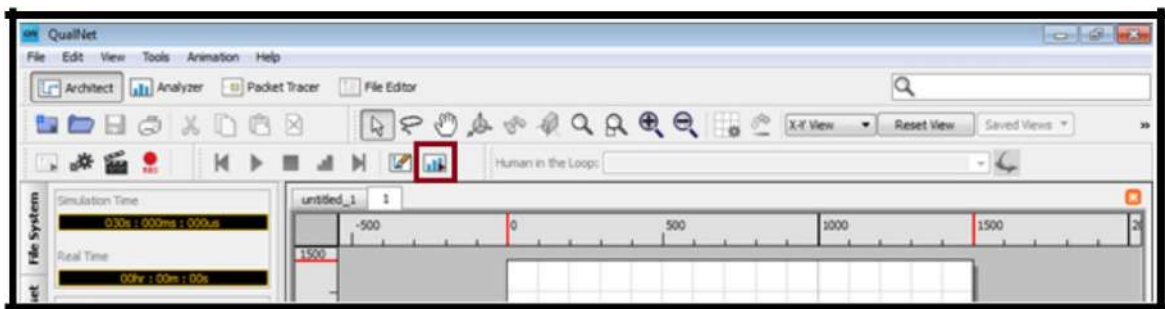

The screenshot shows the 'FTP Generic Properties' dialog box with the 'General' tab selected. The dialog contains a table of properties and their values. The properties are: Source (1), Destination (4), Items to Send (100), Item Size (bytes) (512), Start Time (1 seconds), End Time (25 seconds), [-] Priority (Precedence), Precedence Value (0), and Session Name ([Optional]). The dialog also has a 'Find' button and 'Apply', 'OK', 'Cancel', and 'Add To Batch' buttons at the bottom.

Property	Value
Source	1
Destination	4
Items to Send	100
Item Size (bytes)	512
Start Time	1 seconds
End Time	25 seconds
[-] Priority	Precedence
Precedence Value	0
Session Name	[Optional]

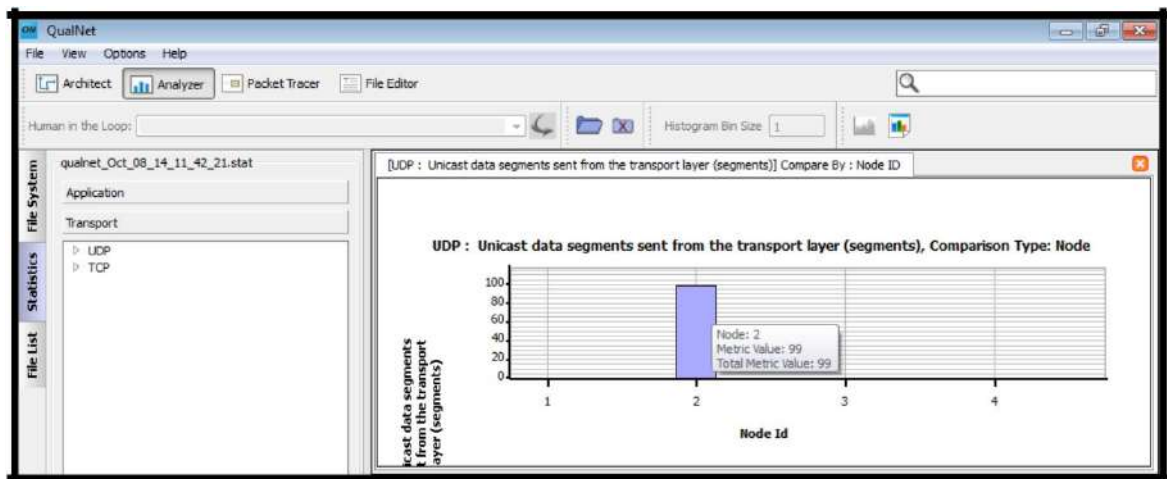

Step 6: Save the changes by clicking on the **Save** button. Click on the **Run** button. Click on the **Play** button to execute the scenario.

Step 7: On completion of the Scenario execution, check the corresponding Statistics for the desired results click on **Analyze statistic**.

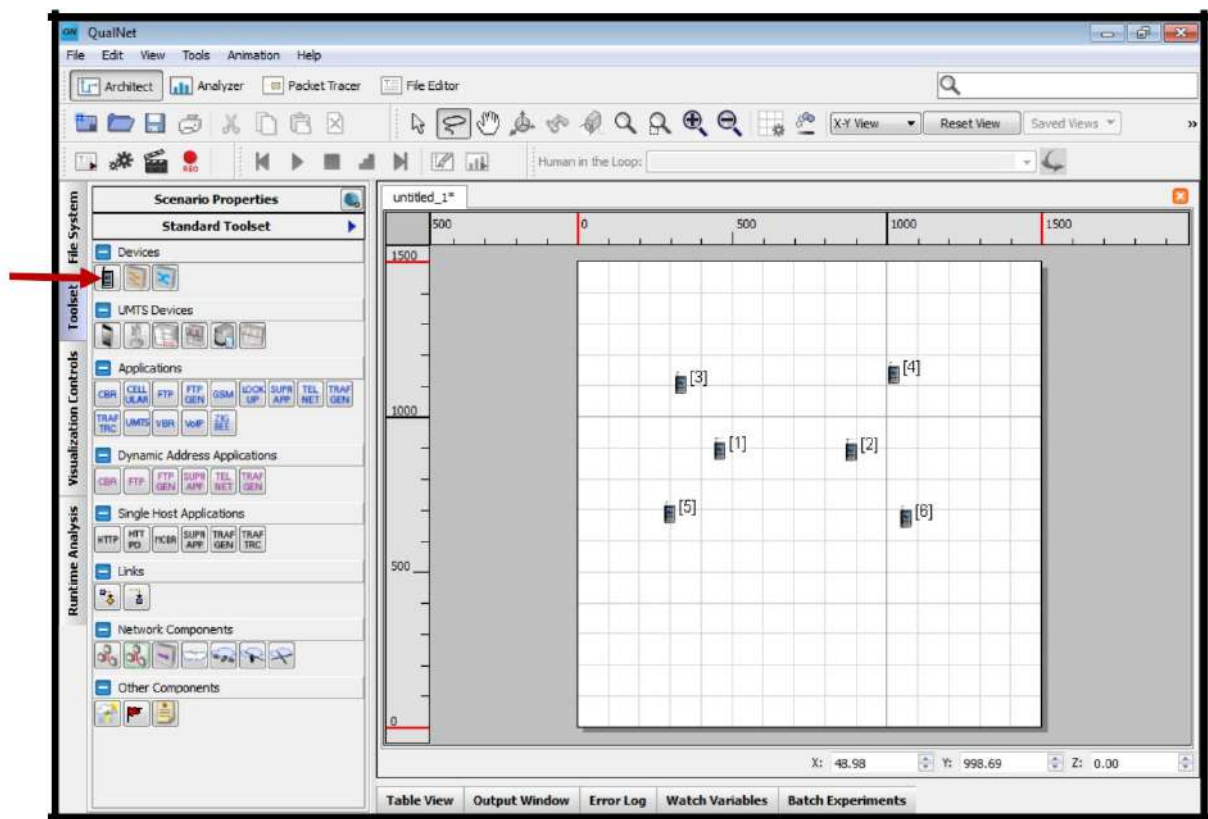

Step 8: To check the no. of packets at UDP, go to Transport tab->UDP
To check the no. of packets at TCP, go to Transport tab->TCP

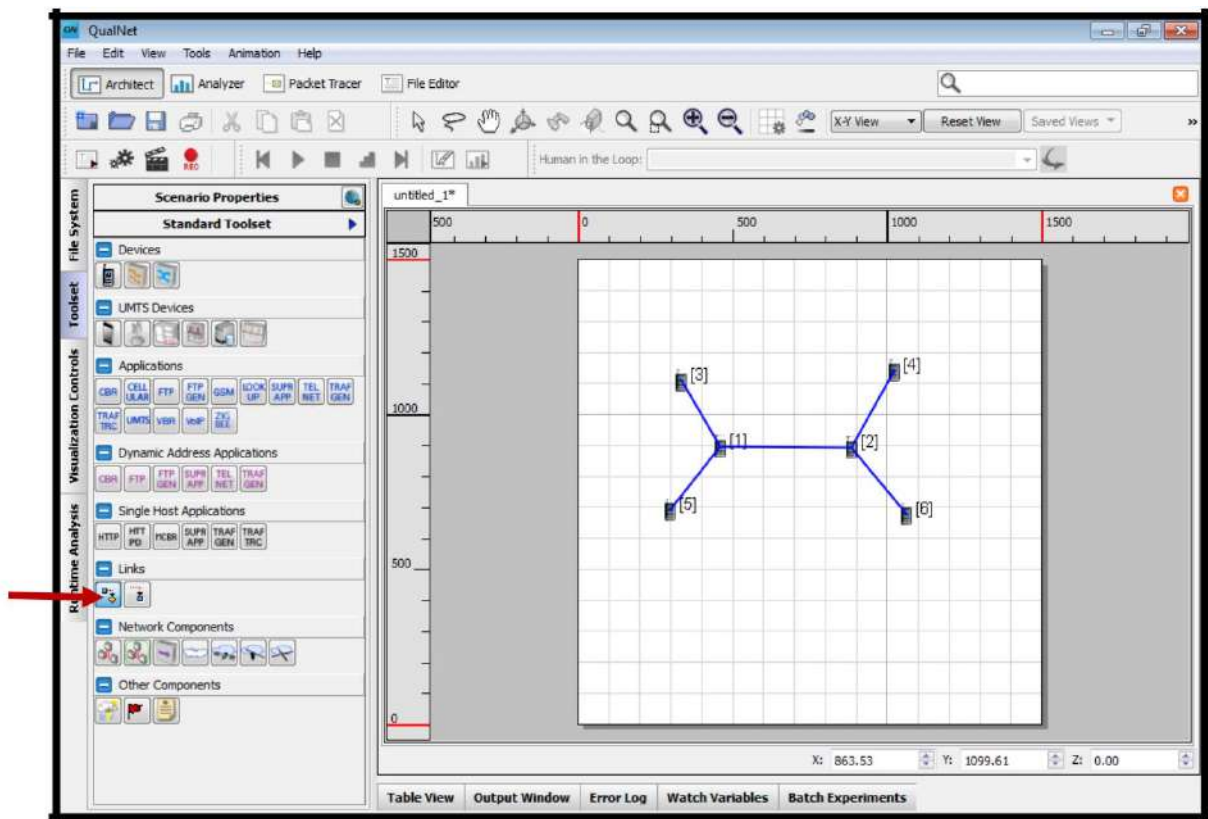

EXPERIMENT NO 3

Simulate the transmission of ping message over a network topology consisting of 6 nodes and find the number of packets dropped due to congestion.

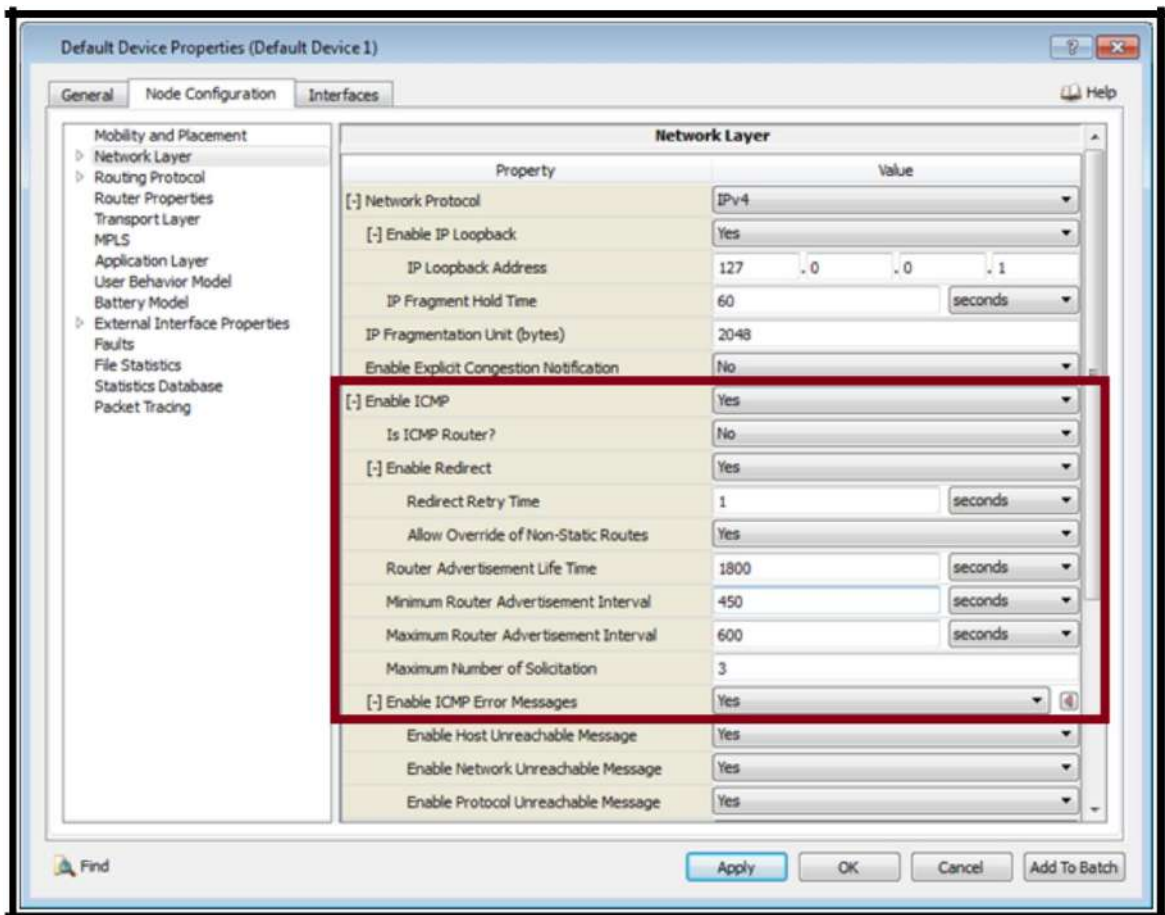

Step 1: Select Default icon from **Standard Toolset window** and Place the Six nodes on the canvas.

Step 2: Connect point-to-point link between three nodes using **link** from **Standard Toolset** window

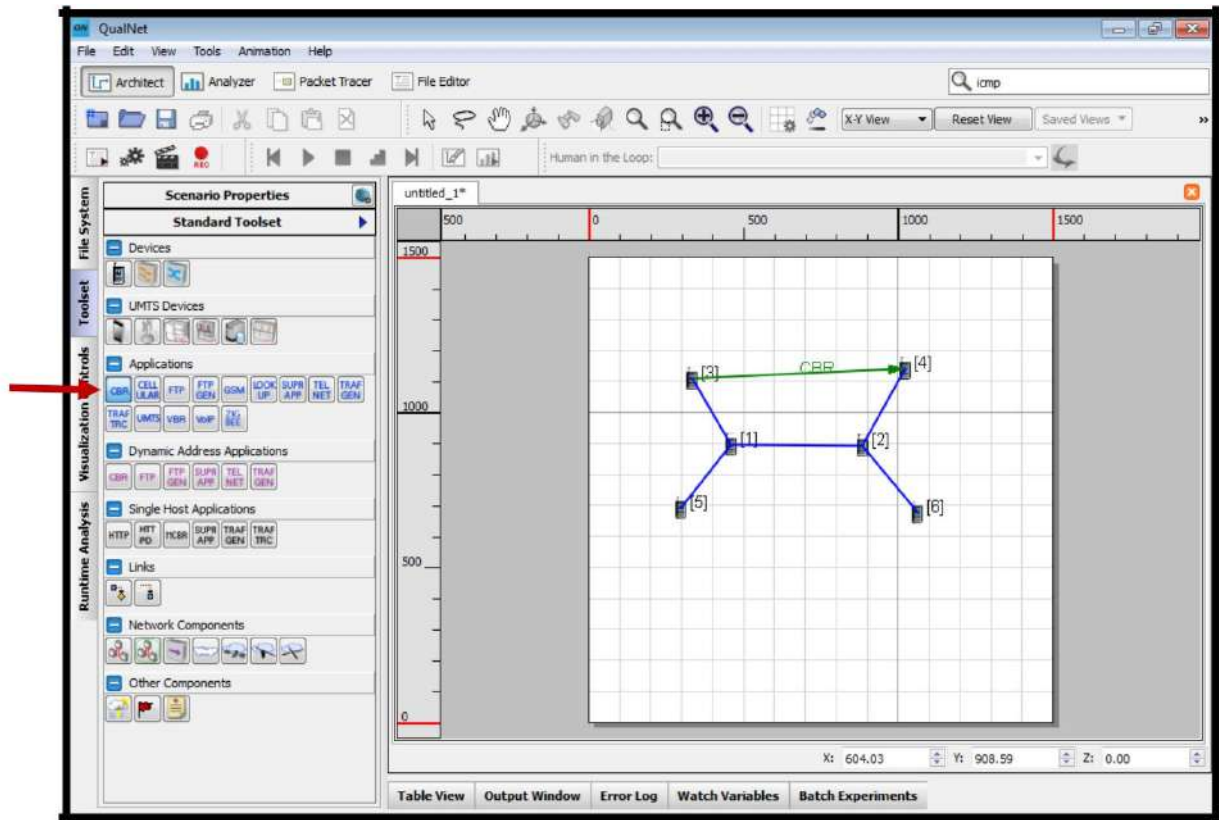

Step 3: To set ICMP of each node in the scenario double click on the nodes, go to Node Configuration tab->Network Layer-> Enable ICMP.

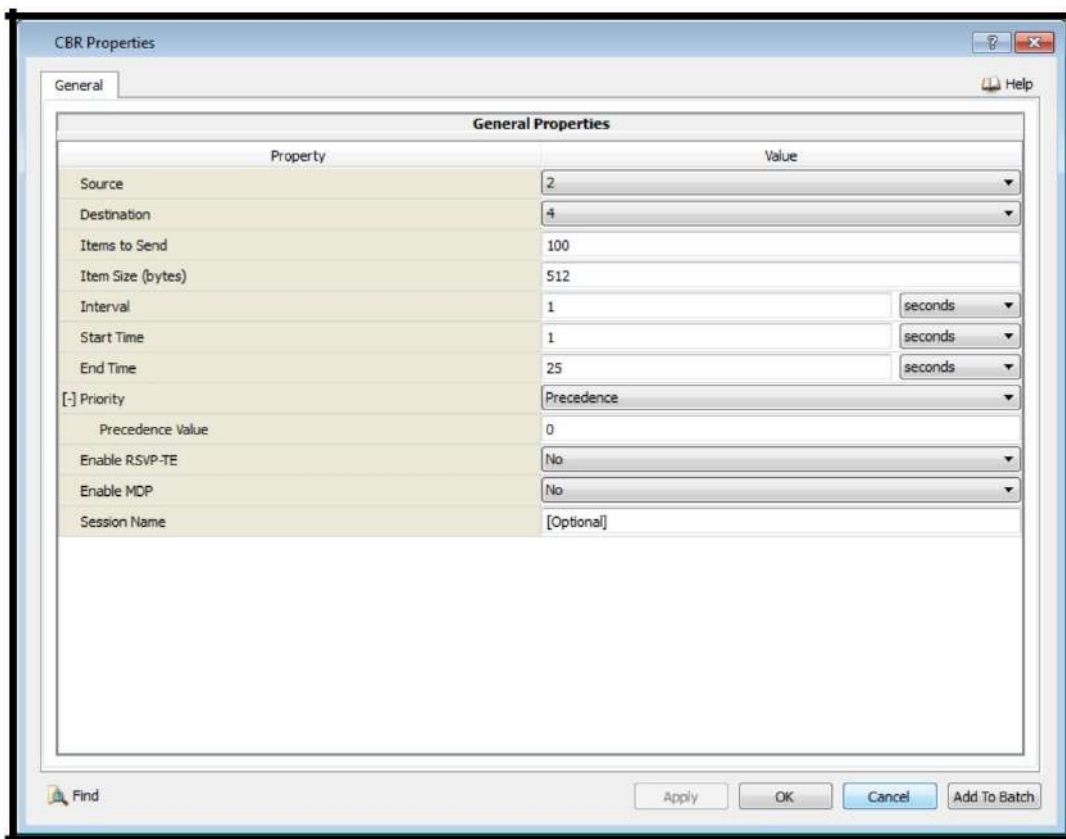

Step 4: Select the **Applications** tab of **Standard Toolset** window

Select **CBR** and draw the application between Node 3 and Node 4.

Step 6: To set CBR Application parameters, go to Table View (bottom panel of GUI) ->Application Tab-> double click on CBR Application

Set the Number. of CBR packets(Items to send) as per the user requirement

Precedence Value	0
Enable RSVP-TE	No
Enable MDP	No
Session Name	[Optional]

Find Apply OK Cancel Add To Batch

Step 7: Save the changes by clicking on the **Save** button. Click on the **Run** button. Click on the **Play** button to execute the scenario.

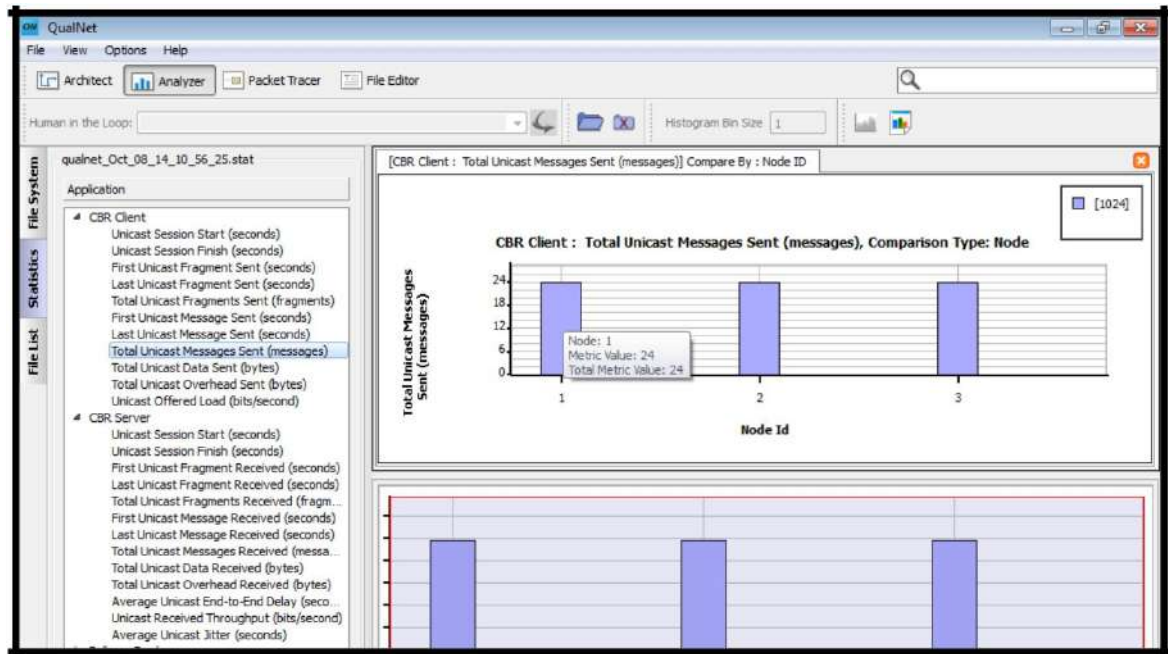

Step 8: On completion of the Scenario execution, check the corresponding Statistics for the desired results click on **Analyze statistic**.

Step 9: To check the no. of packets at sender, go to Application tab->CBR Client->Total Unicast Messages Sent

To check the no. of packets at receiver, go to Application tab->CBR Server->Total Unicast Messages Received

Note: The packet drop is calculated as follows

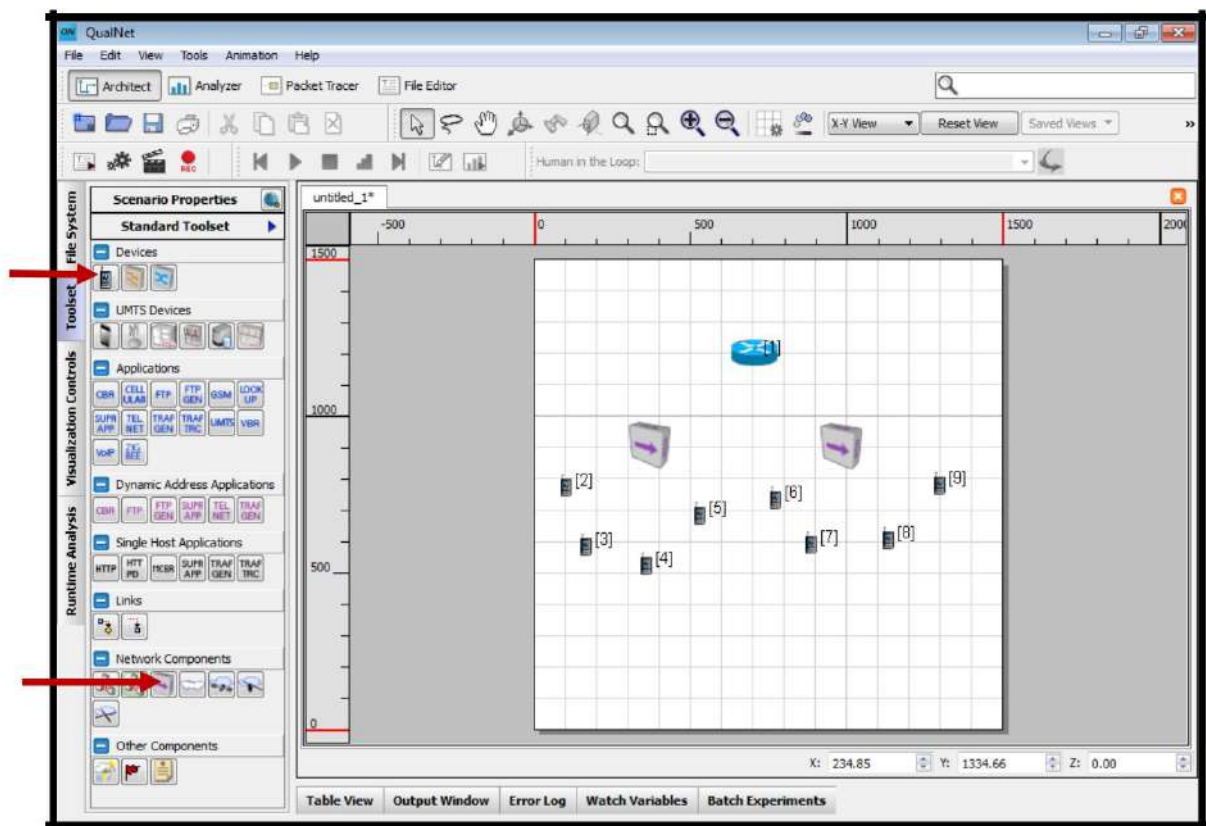

$$\text{Packet drop} = \text{Total no. of packets sent} - \text{Total no. of packets received}$$

EXPERIMENT NO 4

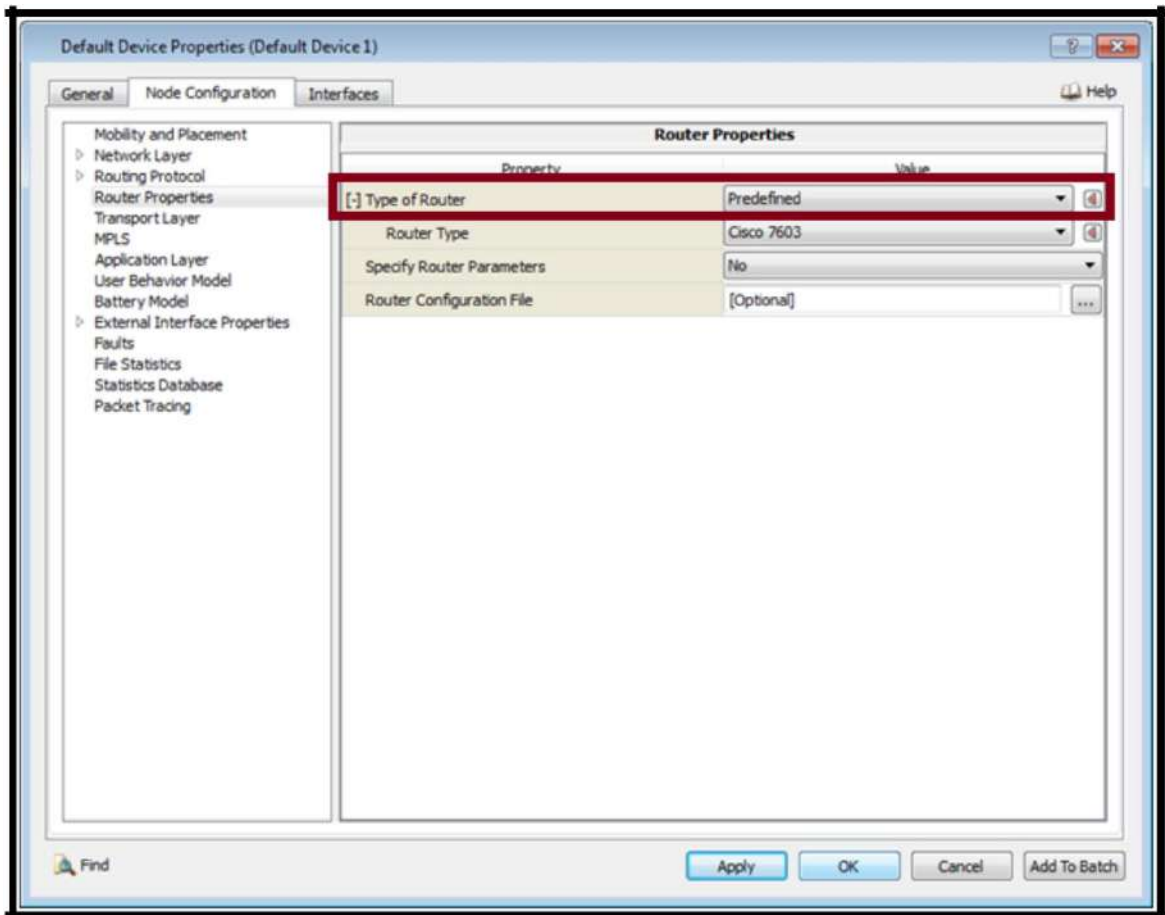

Simulate an Ethernet LAN using n nodes (6-10), change error rate and data rate and compare throughput.

Step 1: Select Default icon from **Standard Toolset window** and Place the nine nodes on the canvas.

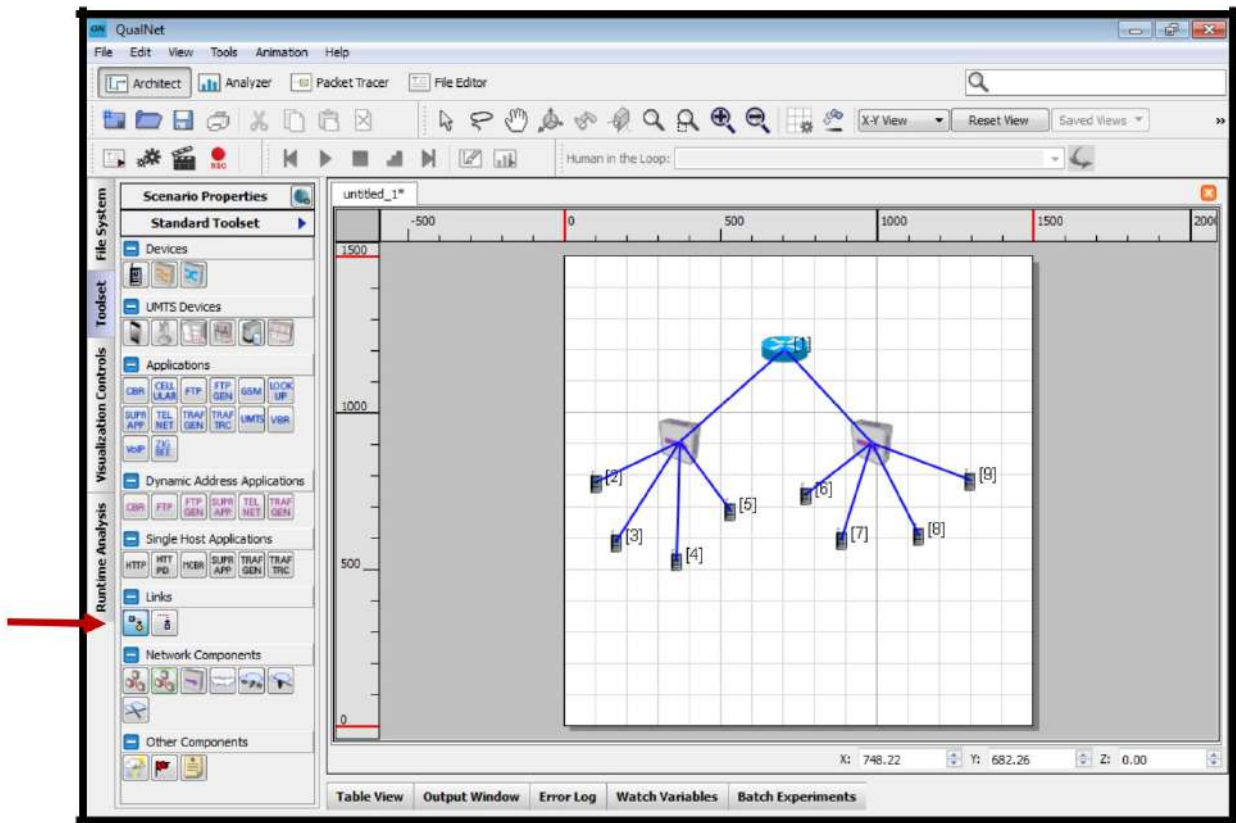

Select hubs from **Standard Toolset window** and Place the two hubs on the canvas.

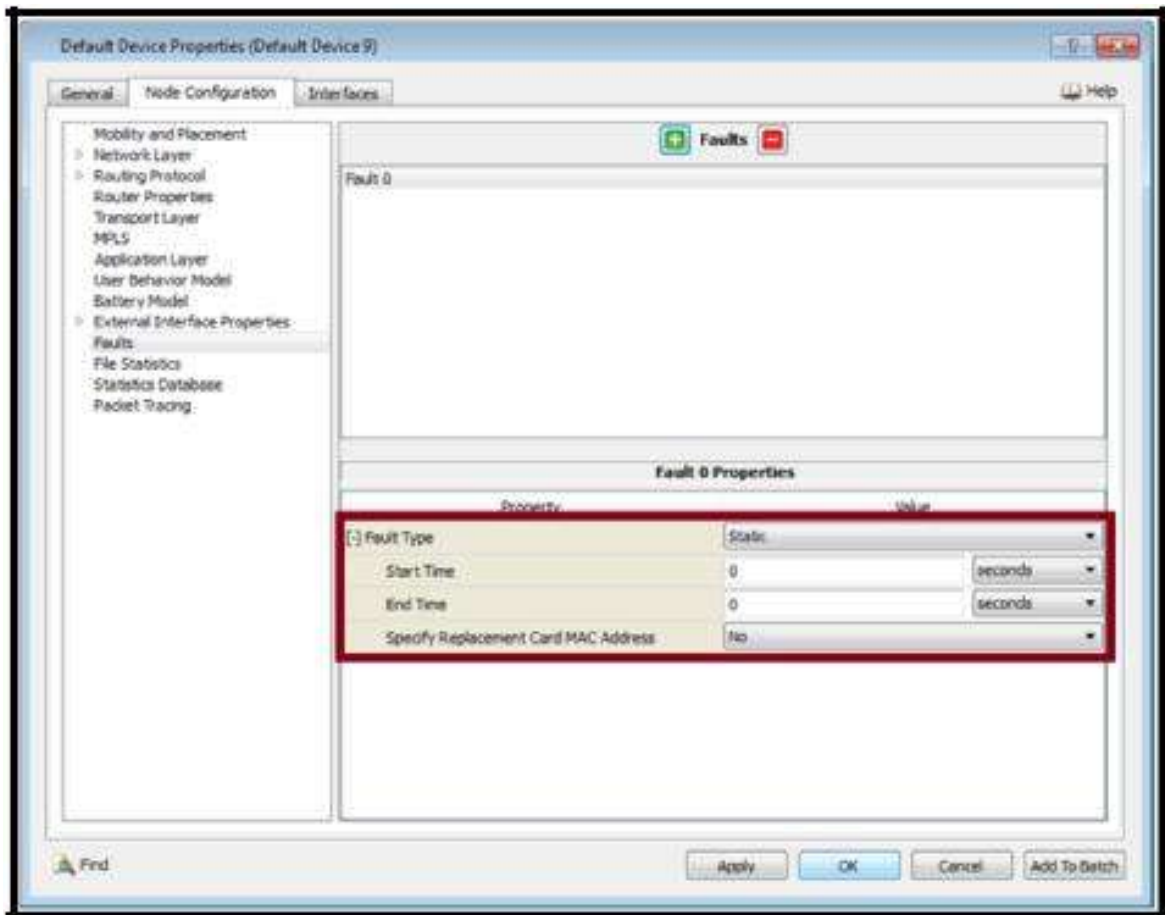

Step 2: To configure node as router double click on the node 1, go to Node Configuration tab->Router Properties->Change Type of Router as predefined.

Step 3: Connect point-to-point link between three nodes using **link** from **Standard Toolset** window

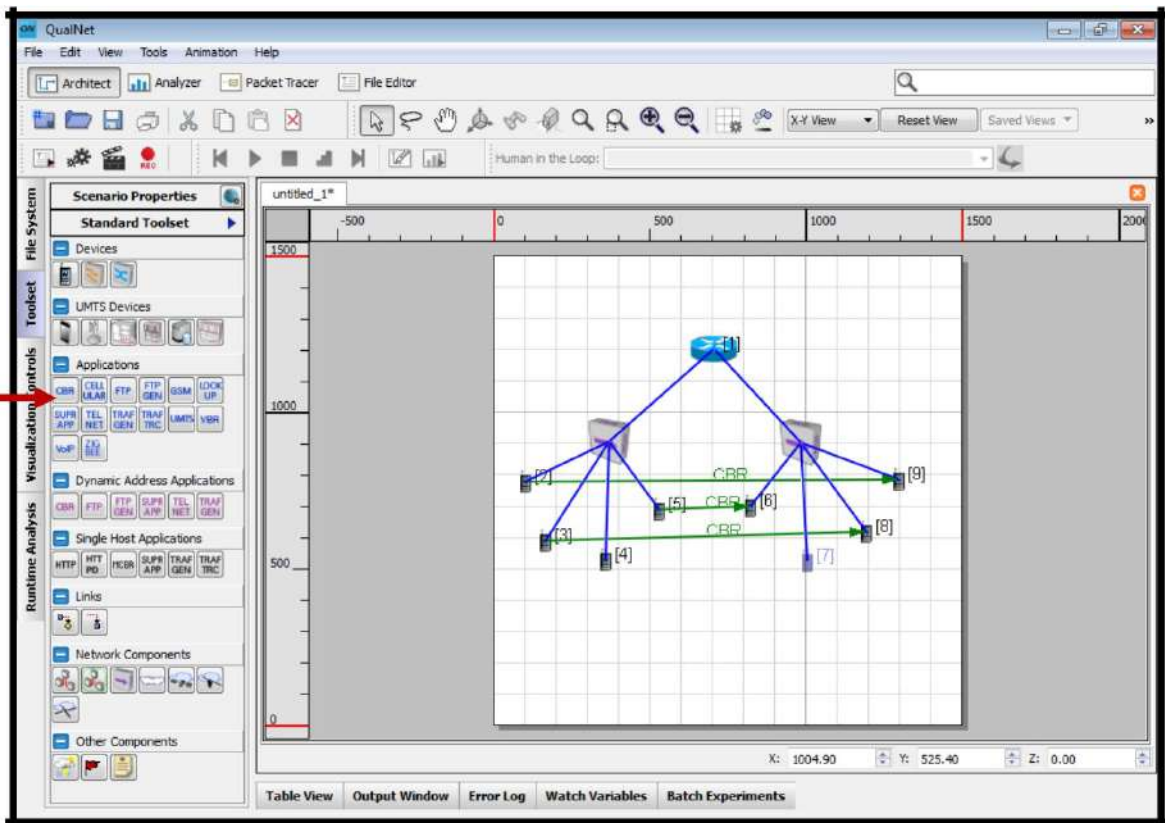

Step 4: To set error rate of the nodes double click on the nodes, go to Node Configuration tab->Faults->configure start time and end time.

Step 5: Select the **Applications** tab of **Standard Toolset** window

Select **CBR** and draw the application between Node 2 and Node 9. Similarly node 5 to node 6 and node 3 to node 8.

To set data rate of the nodes, change item to send packets and time intervals.

Step 6: To set CBR Application parameters, go to Table View (bottom panel of GUI) ->Application Tab-> double click on CBR Application

Set the no. of CBR packet as per the user requirement

The screenshot shows the 'CBR Properties' dialog box with the 'General' tab selected. The dialog box contains a table of properties and their values. The properties are: Source (2), Destination (4), Items to Send (100), Item Size (bytes) (512), Interval (1 seconds), Start Time (1 seconds), End Time (25 seconds), [-] Priority (Precedence), Precedence Value (0), Enable RSVP-TE (No), Enable MDP (No), and Session Name ([Optional]). The dialog box also has a 'Find' button and 'Apply', 'OK', 'Cancel', and 'Add To Batch' buttons at the bottom.

Property	Value
Source	2
Destination	4
Items to Send	100
Item Size (bytes)	512
Interval	1 seconds
Start Time	1 seconds
End Time	25 seconds
[-] Priority	Precedence
Precedence Value	0
Enable RSVP-TE	No
Enable MDP	No
Session Name	[Optional]

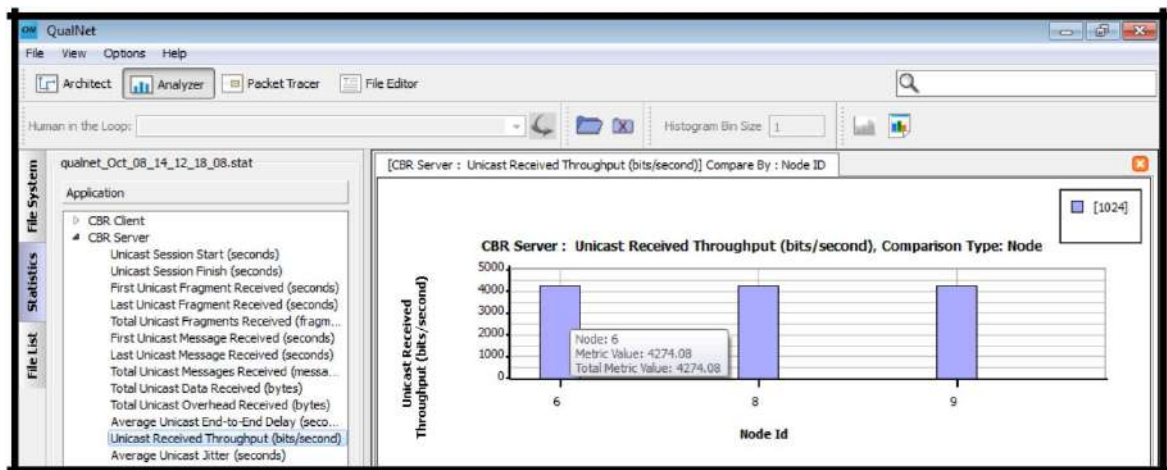

Step 7: Save the changes by clicking on the **Save** button. Click on the **Run** button. Click on the **Play** button to execute the scenario.

Step 8: On completion of the Scenario execution, check the corresponding Statistics for the desired results click on **Analyze statistic**.

Step 9: To check the throughput, go to Application tab->
CBR Server->Unicast Received Throughput

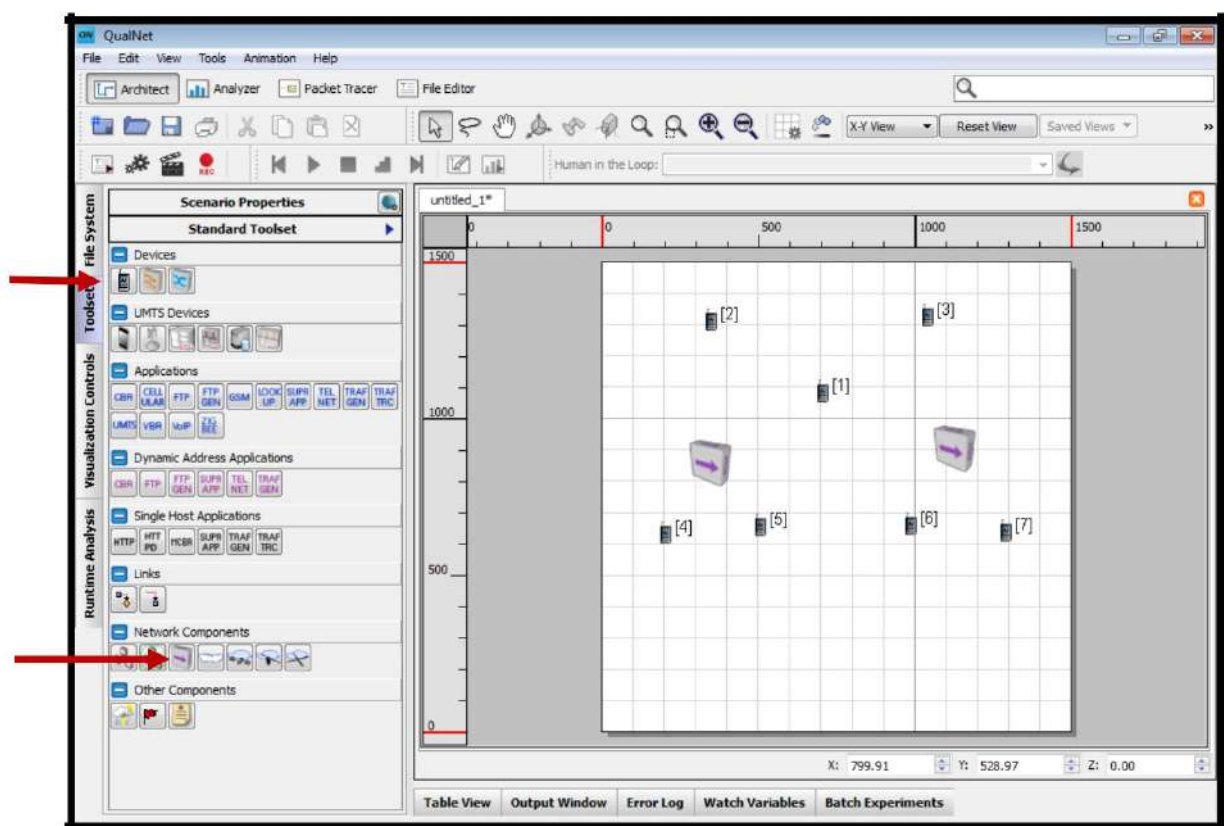

EXPERIMENT NO 5

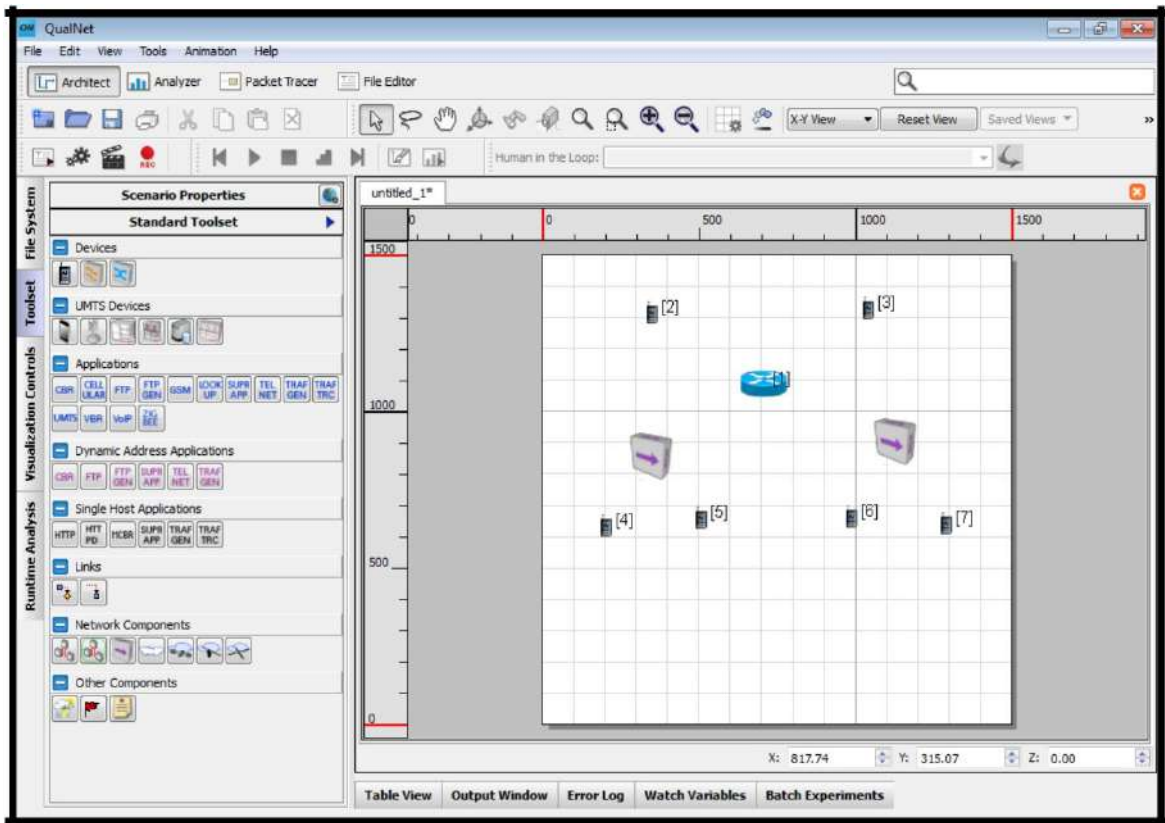

Simulate an Ethernet LAN using n nodes and set multiple traffic nodes and plot congestion window for different source/destination.

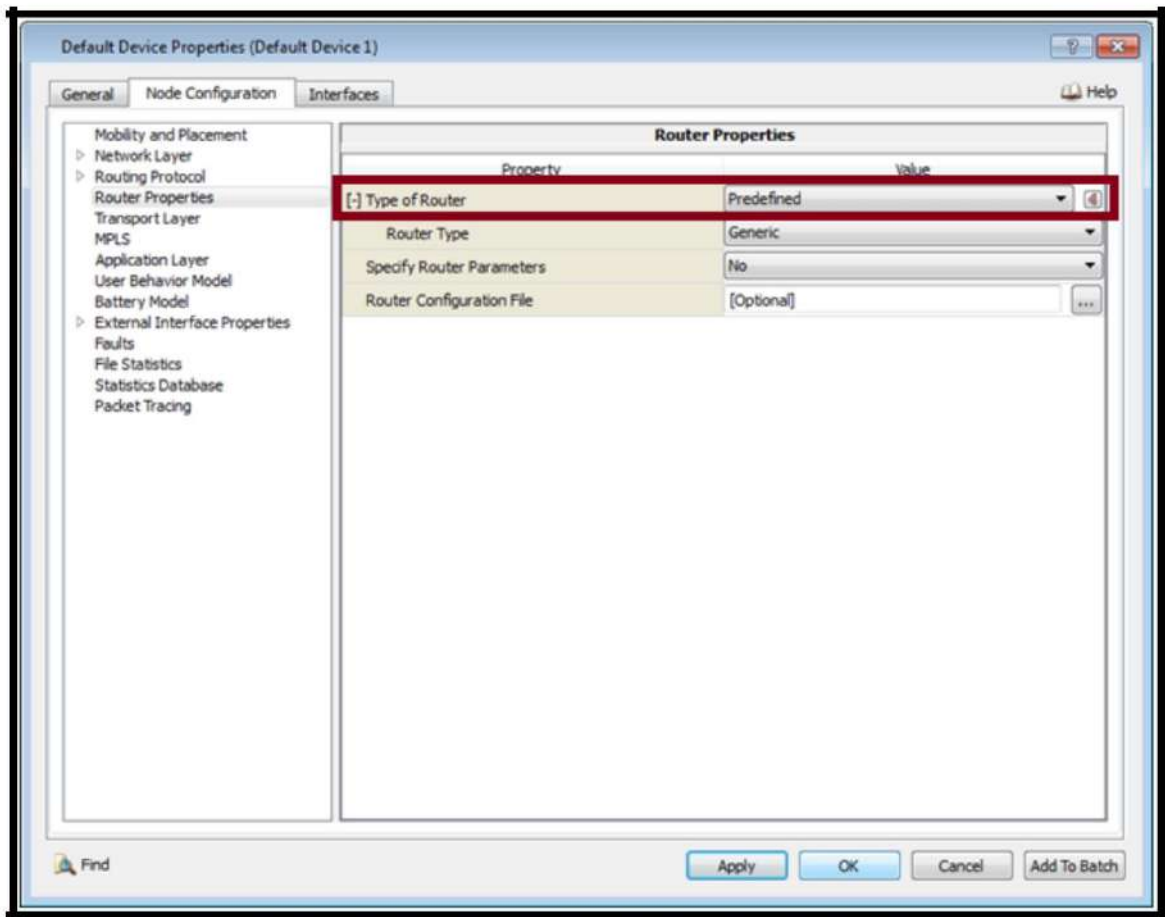

Step 1: Select Default icon from **Standard Toolset window** and Place the seven nodes on the canvas.

Select hubs from **Standard Toolset window** and Place the two hubs on the canvas.

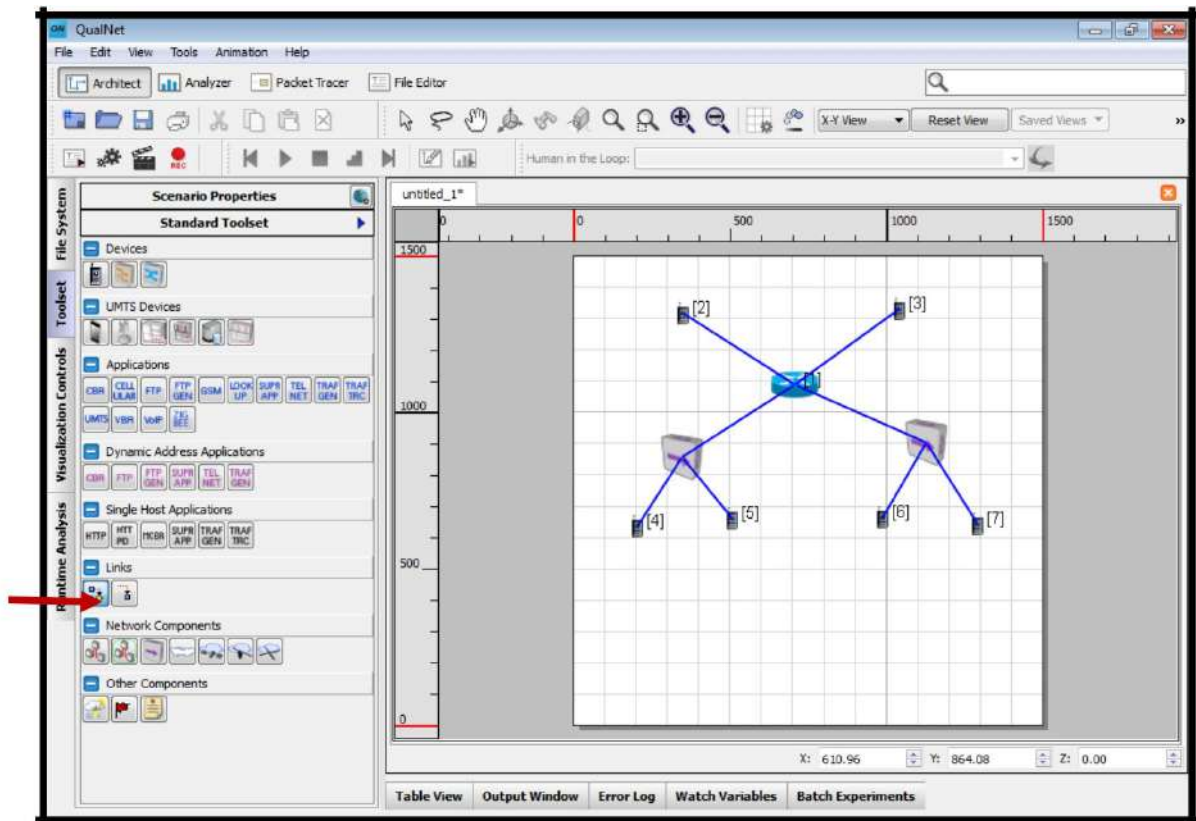

Step 2: To configure node as router double click on the node 1, go to Node Configuration tab->Router Properties->Change Type of Router as predefined.

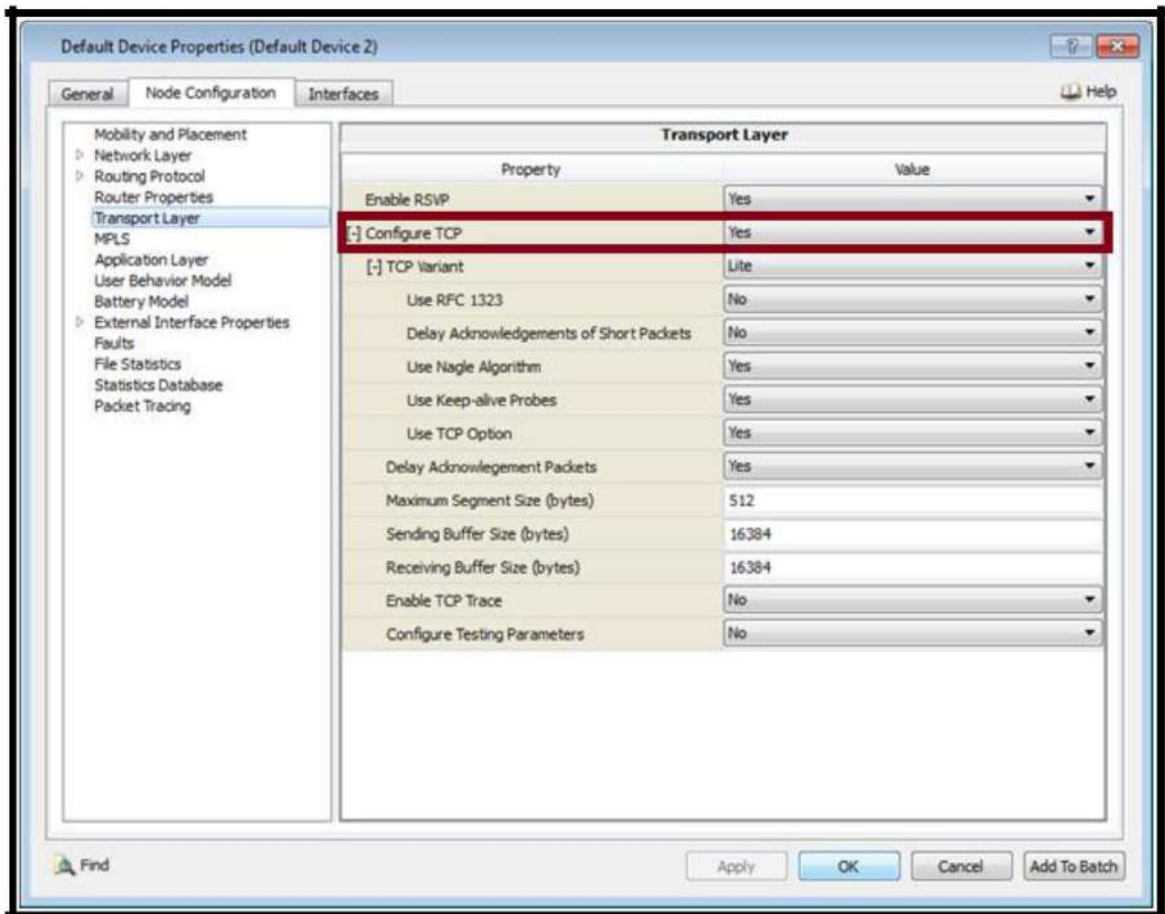

Step 3: Connect point-to-point link between three nodes using **link** from **Standard Toolset** window

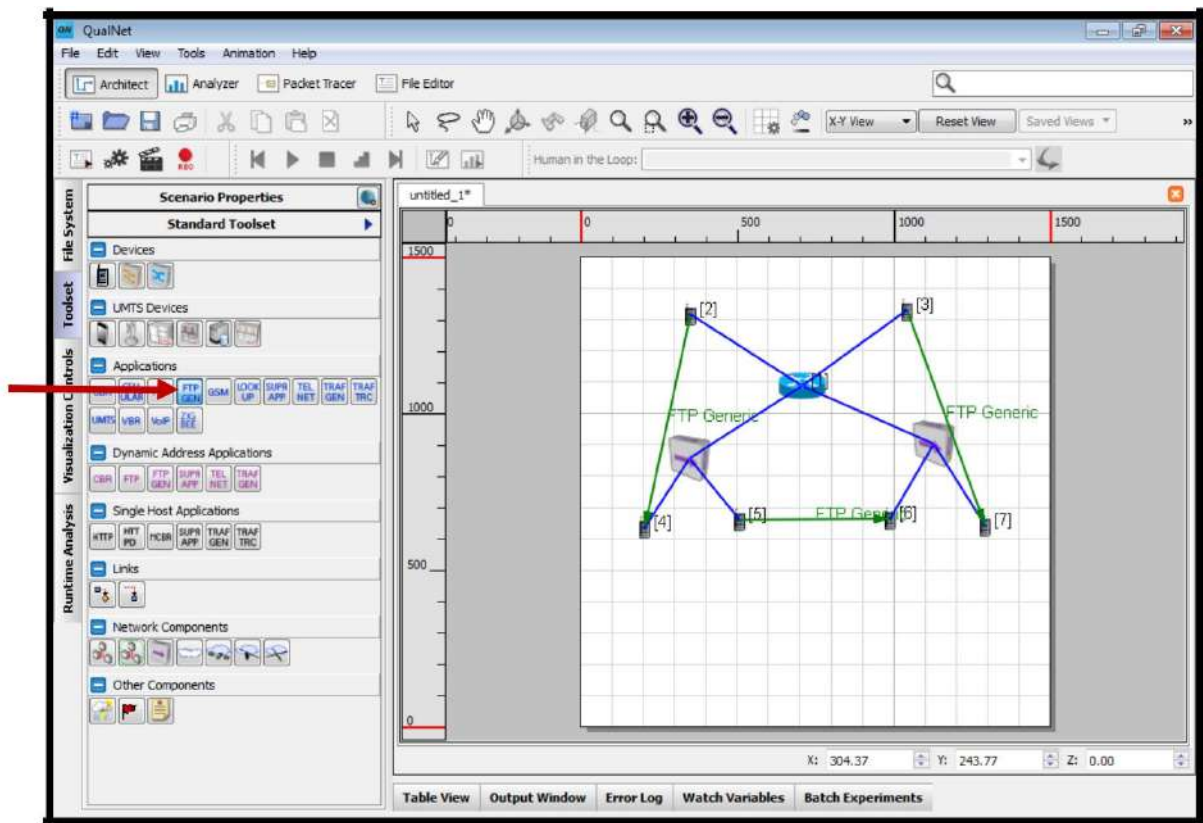

Step 4: To set TCP protocol double click on the nodes, go to Node Configuration tab->Transport Layer->configure TCP as YES.

Step 5: Select the **FTP Generic** tab of **Standard Toolset** window

Select **FTP Generic** and set the application between Node 2 to Node 4,
Node 3 to Node 7 and Node 5 to Node 6.

Step 6: To set FTP Generic Application parameters, go to Table View (bottom panel of GUI) -> Application Tab-> double click on FTP Generic Application

Set the no. of **FTP Generic** packets as per the user requirement

The screenshot shows the 'FTP Generic Properties' dialog box with the 'General' tab selected. The dialog has a title bar with a question mark icon and a close button. Below the title bar is a 'Help' button. The main area is titled 'General Properties' and contains a table with two columns: 'Property' and 'Value'.

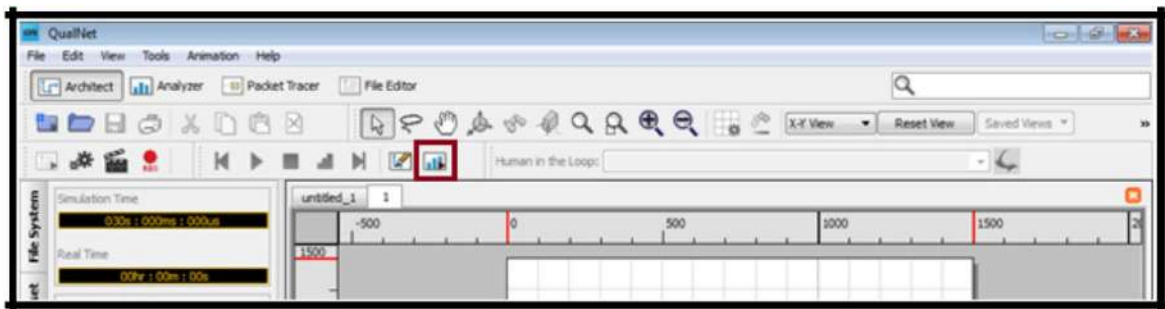

Property	Value
Source	1
Destination	4
Items to Send	100
Item Size (bytes)	512
Start Time	1 seconds
End Time	25 seconds
[...] Priority	Precedence
Precedence Value	0
Session Name	[Optional]

At the bottom of the dialog, there is a 'Find' button with a magnifying glass icon, and four buttons: 'Apply', 'OK', 'Cancel', and 'Add To Batch'.

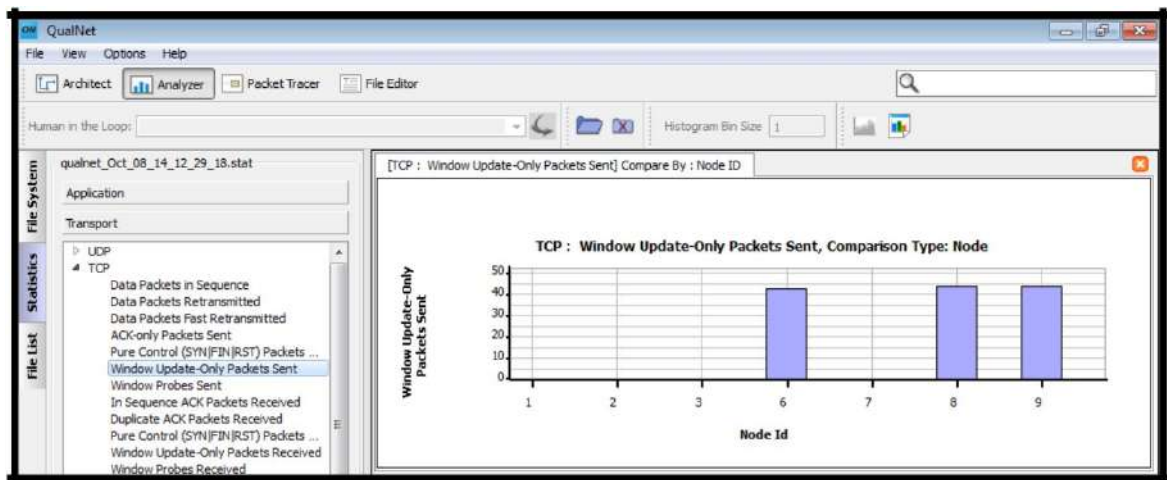

Step 7: Save the changes by clicking on the **Save** button. Click on the **Run** button. Click on the **Play** button to execute the scenario.

Step 8: On completion of the Scenario execution, check the corresponding Statistics for the desired results click on **Analyze statistic**.

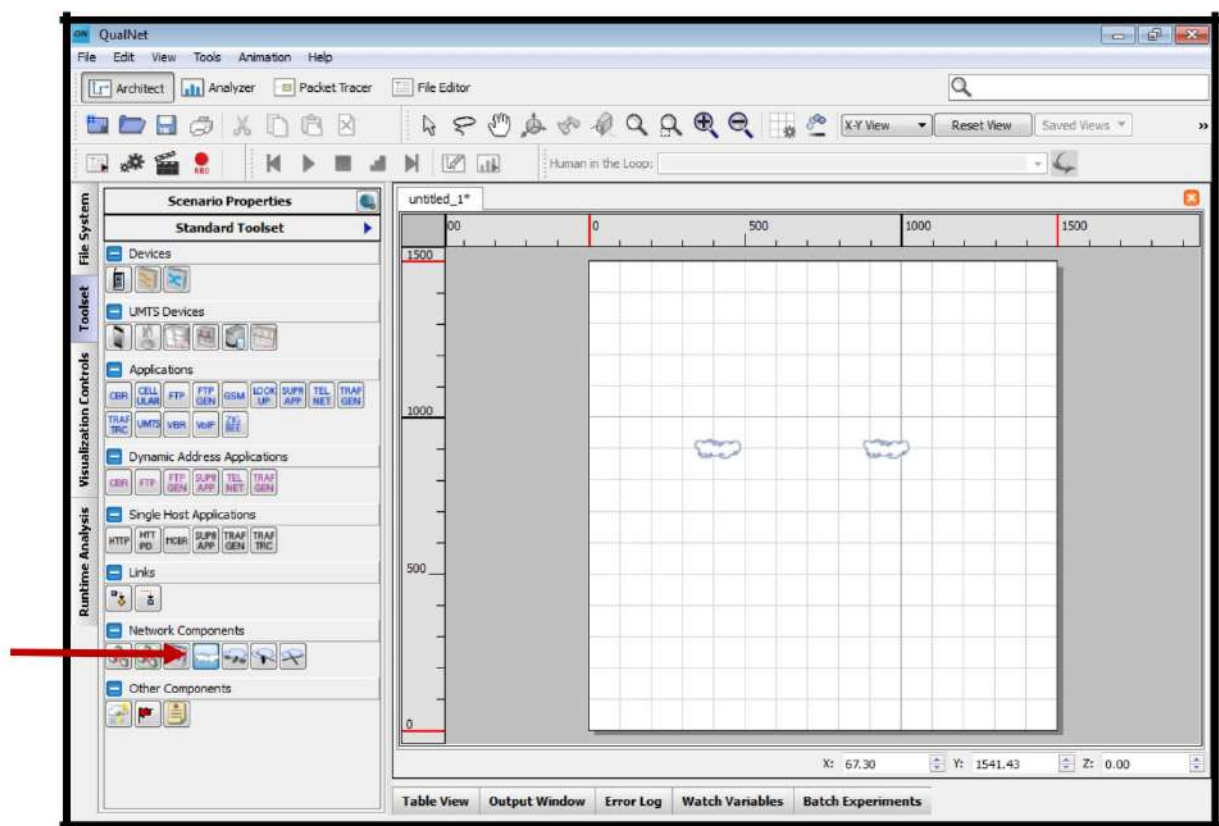

Step 9: To check the Congestion Window at TCP, go to Transport tab->TCP

EXPERIMENT NO 6

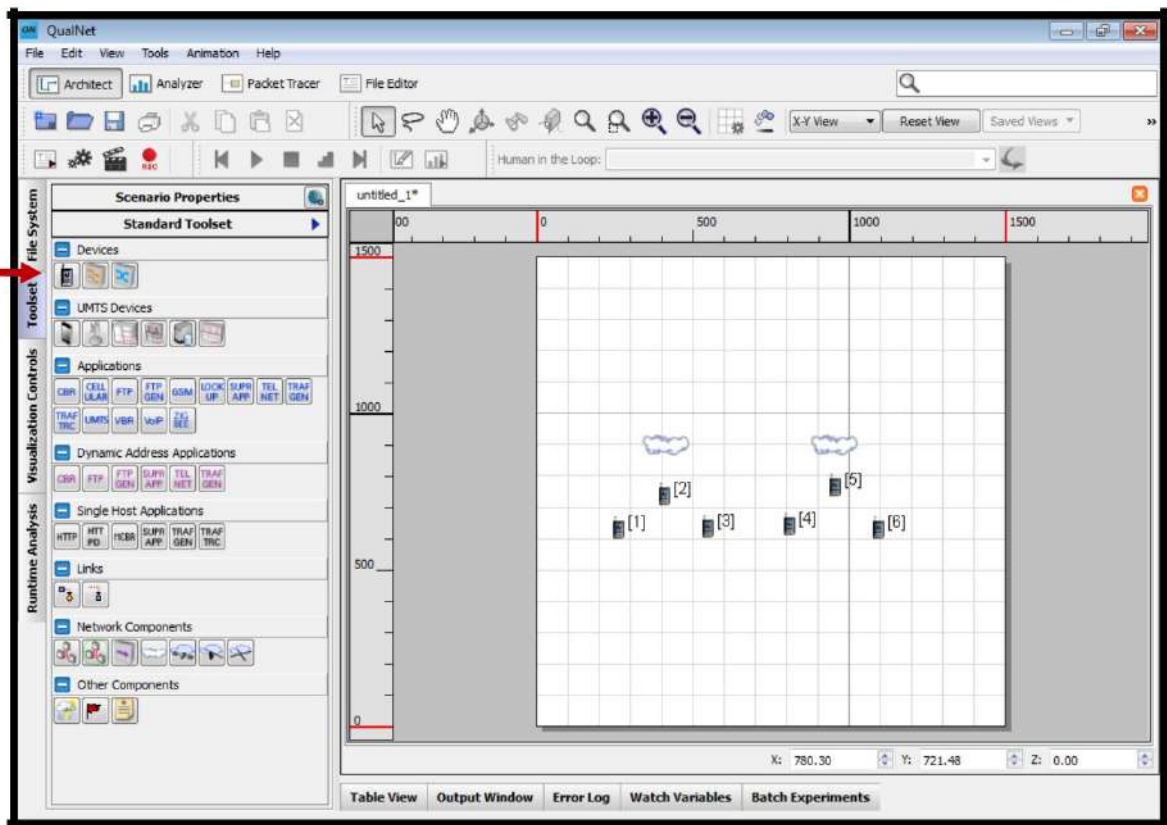

Simulate simple ESS and with transmitting nodes in wireless LAN by simulation and determine the performance with respect to transmission of packets.

Step 1: Select “Network Components” tab of Standard Toolset window
Select “Wireless Network” icon and place 2 subnets for the desired coverage areas

Step 2: Select “Devices” tab of Scenario Designer window

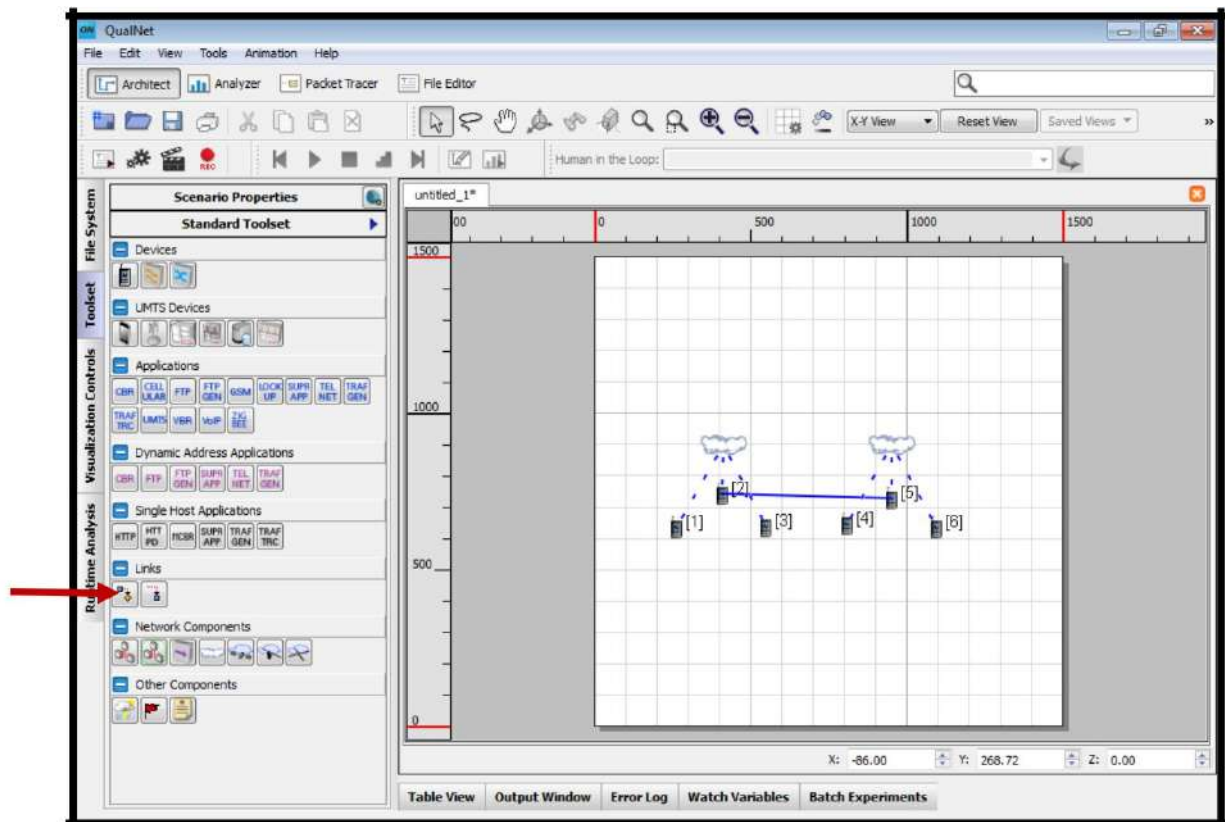

Select “Default” icon and place 3 nodes for each of the Wireless Subnets

Step 3: Select “Links” tab from standard Toolset.

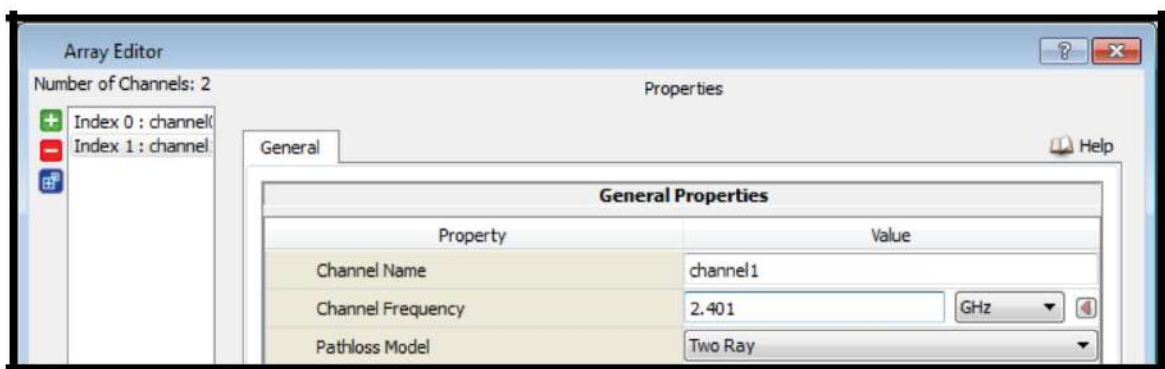

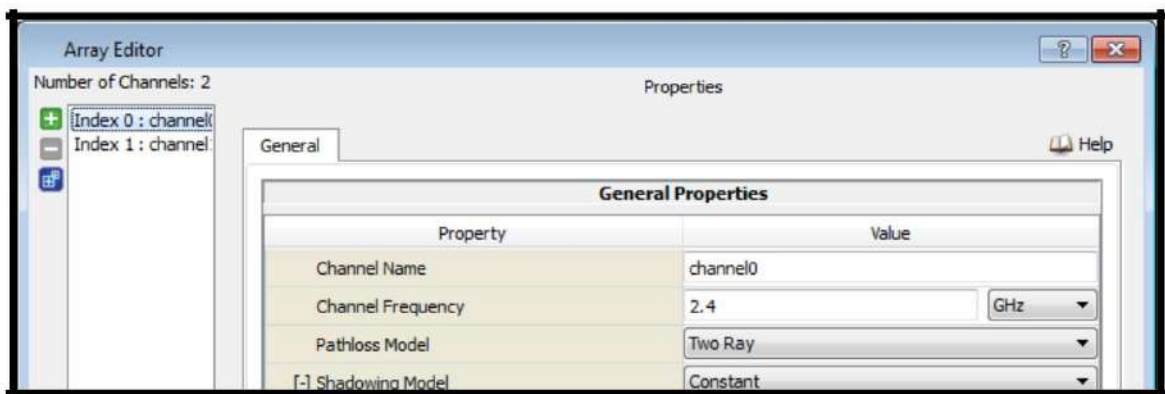

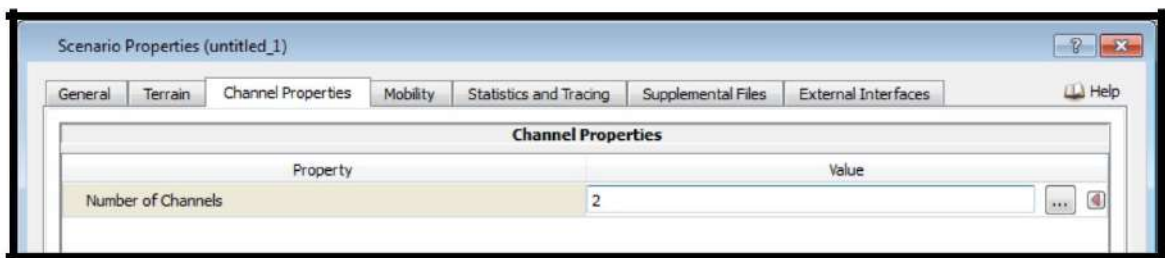

Select “Link” icon and connect all nodes to their appropriate “Wireless Subnet” cloud.

And also using link icon connect point-to-point link between node 2 and node 5(access points)

Step 4: To configure channel frequency of each network go to Scenario Properties->Channel Properties -> Number of Channels -> 2. Set channel frequencies 1 Channels for each network Select “Channel Frequency” and type in desired frequencies for each channel

- Channel0- Frequency = **2.4 GHz**
- Channel1- Frequency = **2.401 GHz**

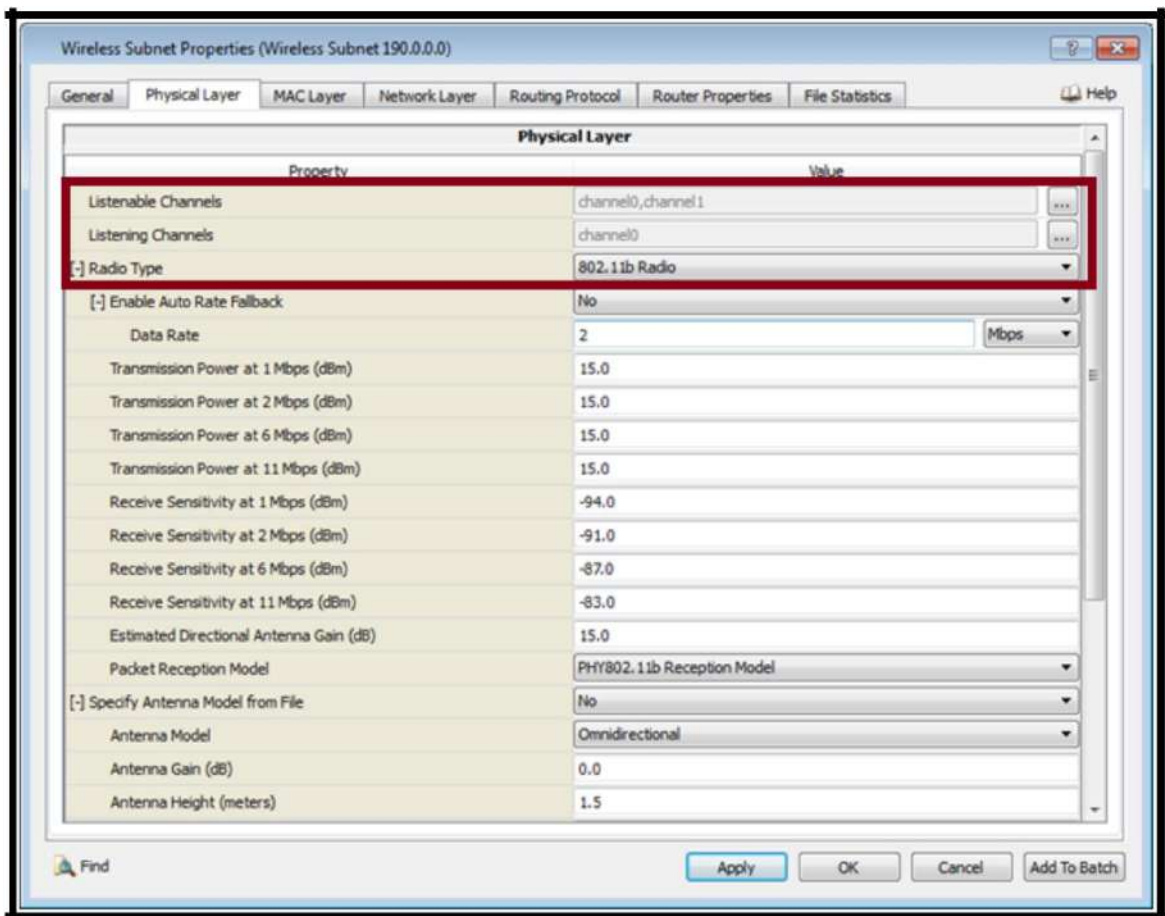

Step 5: To configure wireless physical layer and Mac Layer double click on first **wireless subnet1** and go to Wireless Subnet Properties->Physical Layer

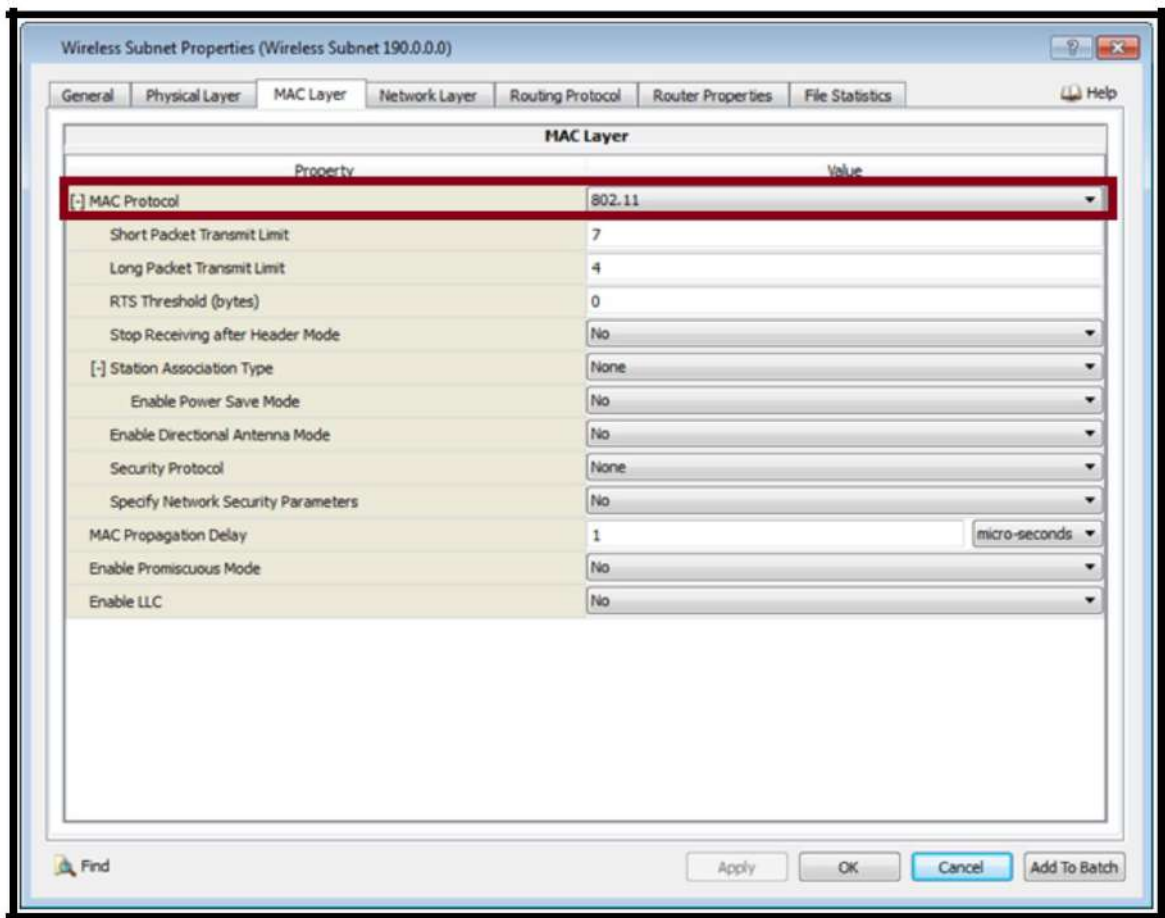

Set "Listenable Channel Mask" as **channel0, channel1**

Set "Listening Channel Mask" as **channel0**

Set "Radio Type" as 802.11b Radio under Physical Layer

Set "Mac Protocol" as 802.11 Radio under Mac Layer

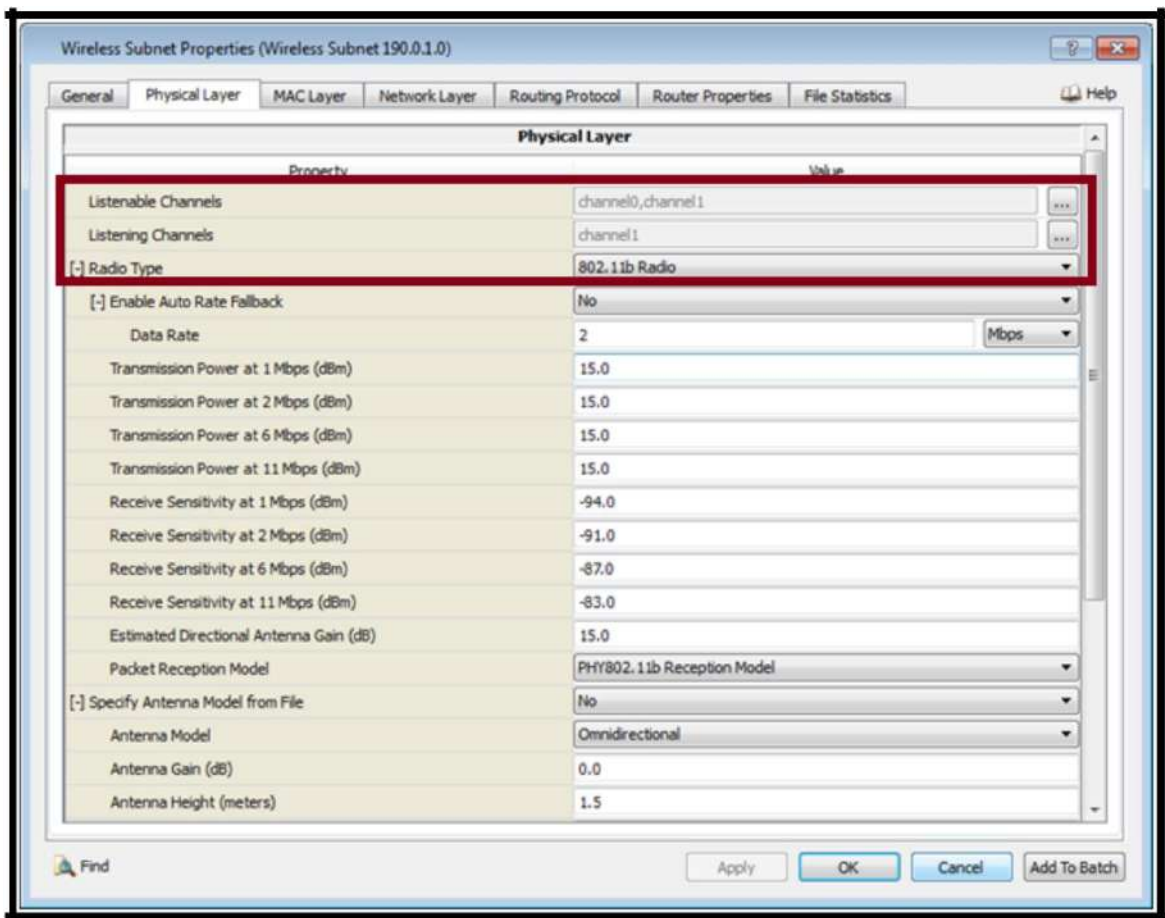

Step 6: To configure wireless physical layer and Mac Layer double click on first **wireless subnet2** and go to Wireless Subnet Properties->Physical Layer

Set "Listenable Channel Mask" as **channel0, channnel1**

Set "Listening Channel Mask" as **channnel1**

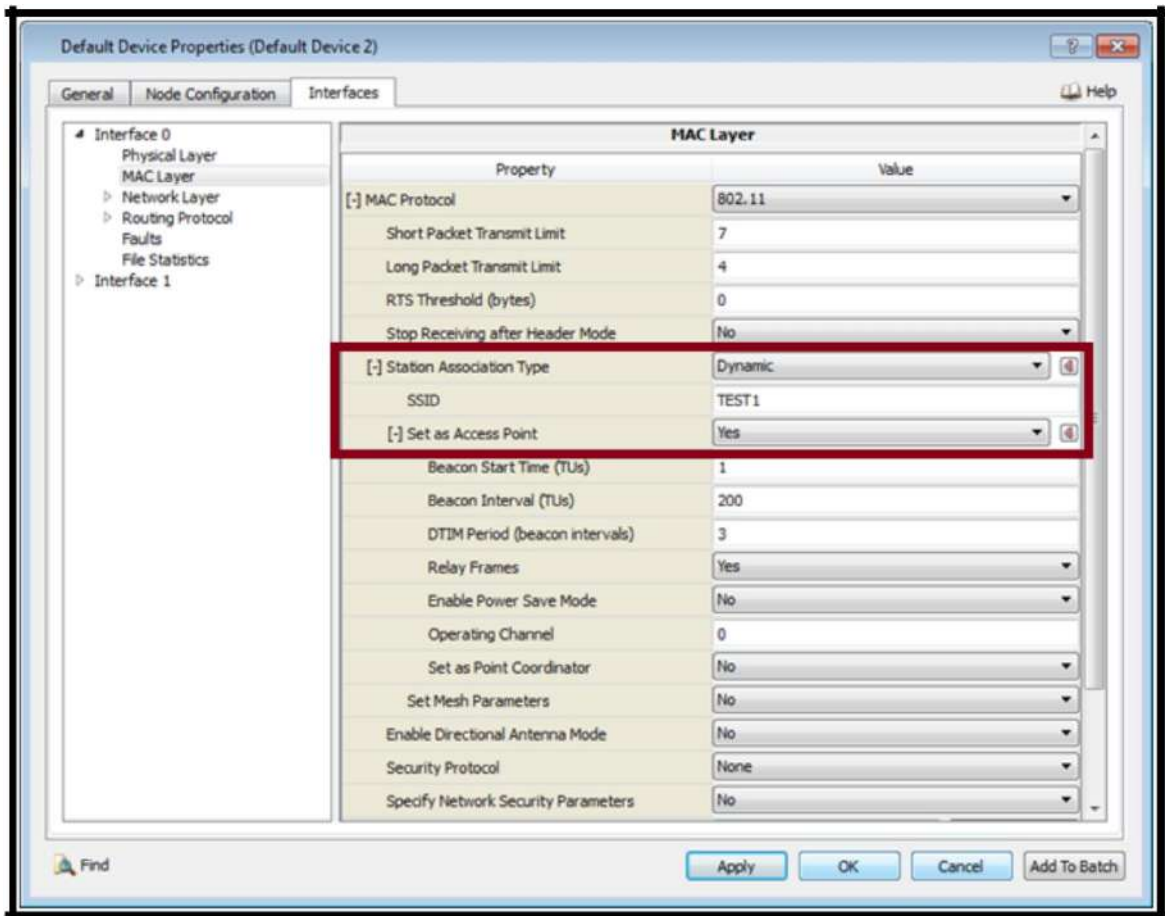

Set "Radio Type" as 802.11b Radio under Physical Layer

Set "Mac Protocol" as 802.11 Radio under Mac Layer

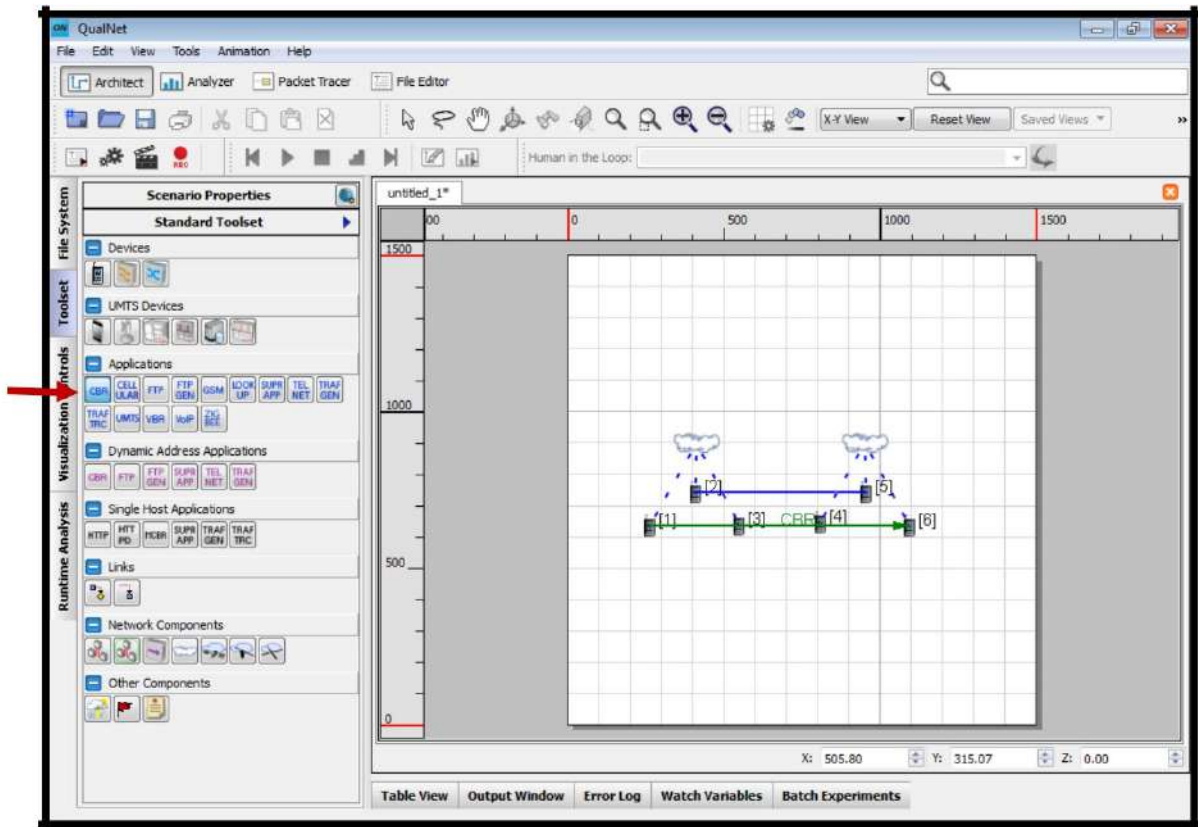

Step 7: To set node 2 as **Access Point**, double click on node 2 go to interfaces tab-> Interface 0-> Mac Layer
 Select “Station Association Type” as **Dynamic**
 Select “Set as Access Point” as **Yes**

Similarly configure node 5 as **Access Point**

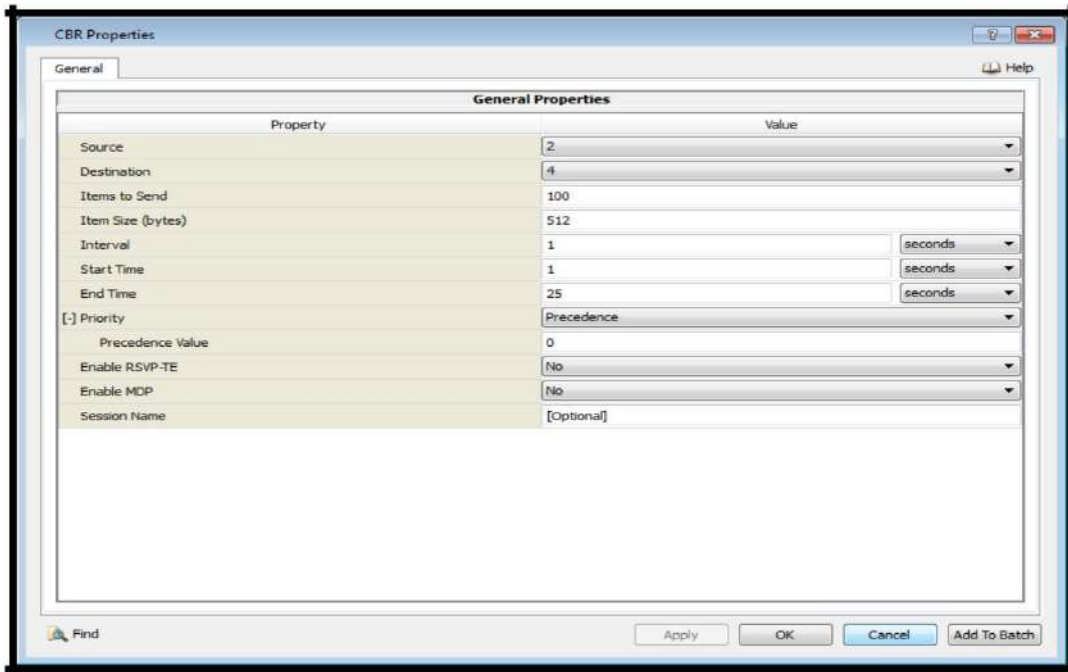

Step 8: Select the **Applications** tab of **Standard Toolset** window

Select **CBR** and draw the application between Node 1 and Node 6.

Step 9: To set **CBR Application** parameters, go to Table View (bottom panel of GUI) -> Application Tab-> double click on CBR Application

Set the no. of **CBR Application** packets (Items to send) as per the user requirement

CBR Properties
